## 1. 800XL anomoly?

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-01 00:30:17 UTC
From: JP <myemail@home.com>
Message-ID: <tEqQ9.579633$QZ.83441@sccrnsc02>
Source record: 24414

Hello all,

I was reading through the 8-bit faq and came across the section on 'Basic'...So I thought I'd go through all my carts and systems and check 'em out.. One of my 800XL's is reading '234' with ?peek(43234) - which means it has rev. c basic. I re-read through the faq, and it seems this should be rev. b like all the rest of my 800XL's. Do I have a rare late model 800XL? Or am I just getting excited for nothing?

Thanks!

I'd suspect someone bought a rev C ROM (or ripped it out of a 130xe with a dead keyboard) and plugged it in.

But it is possible, I suppose.

David P.

## 4. Mar Tesoro

Newsgroup: comp.sys.atari.8bit

Anyone remember the game Mar Tesoro?

A game written in BASIC in which you look for sea treasure.

Has anyone ever gotten the game to LIST? Someone told me that it used a method of loading the program into lower memory thus causing the computer to lock up whenever you tried to LIST it, but I am curious as to some of the programming techniques used in the game (this is a major way that I learned how to program in BASIC) and would like to see a listing if possible.

They should shoot the guy that invented Passive Mode. It often screws me up too.

How come TXG keeps advertising his FTP web site, yet in about 5 or 6 posted messages, I still haven't seen a link to it?

Which leads me to another question.. You say a 'dead keyboard', one of my
800XL's has a dead keyboard (all except rst,sel,start,option). I've been
trying to diagnose it with the schematics but can't figure it out yet. Are
dead keyboard issues lost causes?

thanks!

Ok, I'll go ahead and pick my nit all the way so I might explain what I
meant by 'internet access'. I use my PC for internet too, and you are
right, having a good 5 1/4" drive is half the battle, but its not the
whole fight at all. Any PC that could do the internet won't have a
floppy controller that can do FM which means Anadisk won't work for
Atari SD or ED. Its these programs I refer to that just don't work
on today's computers due the lack of a pin being used on the I/O chip
which has come to incompass the floppy disk functions. It used to be
just a floppy disk controller, now the function has grown to IDE drives
and many more devices.

I don't doubt that MyUtil does work flawlessly when you format transfer
disks on the PC first, just like Ataridsk but more 'DOS' like, I'm sure.
That was never my point, the point was to read _Atari_ formatted disks
on the PC using _any_ method possible. MyUtil will do that - but only
marginally and if its a big file or in the wrong place on the Atari disk
it won't do it all unless you can make a copy of the disk and swap that
one in at the appropriate time.

MyUtil (PCXFer) is the only program that can read Atari formatted disks
with the above restrictions and that is using DD only. There is nothing
that works for ED or SD disks on todays 'internet ready' computers due to
the lack of FM support in those floppy disk controllers. You have to go
way back to get a computer with FM capability, so my question is how far
do you need to go back before Anadisk will read in an Atari SD or ED
disk?

Turns out its not the drive - its the controller.

The first game I ever got for my Atari was a cartridge of Up'n'Down (still have it.) The second game was: Guess What's Coming to Dinner by Educational Software. Unfortunately, my disk of this game died sometime and I threw it out (I think.)

Does anybody have it in either ATR form or binary executable form that they could send to me?

Yes, late model 800XL's also have Rev. C BASIC, mine does. The one that
belonged to my cousin didn't, I got the ROM chip to replace its Rev. B
one, but that one has all chips socketed as opposed to the later models.

Hello All,

The link I posted last night for my eBay auctions split over 2 lines, so you will need all of the 2 lines to make it work. Therefore, you'll need to copy the link into your browser rather than clicking it as I suggested in my last post. The link is:

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=deangar raghty

This might be true for some, and perhaps even most, modern computers, but
it's not true for all computers capable of Internet access. I've used
AnaDisk to read SS disks on a system with an AMD K6 233 CPU and a VIA
chipset (I don't recall the precise model number). It worked fine. I've
never tried ED disks, but the documentation I've read on the subject says
it won't work reliably.

## 18. Re: Soldering tips from your favorite Mutant

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-01 16:42:06 UTC
From: ronfucci@bellsouth.net
Message-ID: <3e13188e.80002527@newsgroups.bellsouth.net>
Source record: 24431

Jeff,

Can you offer some advice on how to repair a broken trace ? I thought I did a handy job of desoldering the OS chip from my beloved 130XE (for the purpose of installing a socket for Omniview XE) only to find the chip nearly impossible to remove because of resin that made it adhere mightily to the board. Of course as I removed the chip (this is the non-handy part), I pulled up a trace attached to one of the pin sockets.

The trace is mostly intact, but I would like some advice on how to reattach the trace. Don't know if this is helpful, but looking down on the motherboard in the U5 slot, it is the 5th trace from the right. The trace tear starts just above the solder point in the upper third of the trace and continues up to the pin connection above it.

I've also considered soldering a wire from that solder point to the corresponding pin of the socket I will be installing.

It's been an adventure, but my enthusiasm for the unknown goes only so far, and your guidance would be appreciated.

Thanks.

ron

Never saw it nor had opportunity to check the method for LISTing
prohibition.

Most likely, it was the old standby POKE PEEK(138) + 256*PEEK(139) + 2, 0...
which destroys the line length pointer so that BASIC is unable to find and
execute immediate mode commands.

There were several methods and utilities to unlock that scheme and we
jointly wrote another with someone from the Pacific northwest on this list a
year or so ago. We even included reconstruction of the Variable Name Table
if needed all in pure Basic with NOTE and POINT and GET and PUT so that it
actually patched the copy on disk..

There are always shell accounts too. I have heard that they are no longer
being offerred by a lot of services. I know for my Netmagic account it costs
extra and has been seriously nerfed.

Lowest level I ever accessed the internet on was with a Heath 19 terminal.
The H19 was better then the Atari because of the 80 column screen.

## 21. Re: Percom / Tandon Drive problems

There was a great article on those in Atari Classics by Ben the 8-Bit Alchemist; all I know about Percoms came from there. It might help with some of those settings and I put it up on my site.

I would certainly think that adding or replacing mechanisms is an option if you have access to the 34 pin controller connection. Let us know if you find a cache of those 360K mechanisms which are getting a little rare in Oklahoma.

IMO that is the best solution. Just remove the remaining part of the
trace and solder a wire from the pin of the socket to a nearby pin
the original trace was connected with.

Schematics can be quite helpful to find the correct pin, but in case
of the Atari it's also quite easy to just follow the trace to the
next connection point.

so long,

Hias

## 23. Clearout - Free Atari magazines (genuine offer)

Source record: 24436

Hello All,

I've been clearing through some items today, and discovered 16 sets of my old DGS News-Paper printed magazine that were published around 9 years ago. We published on paper for 5 issues, but issue 16 sold out years ago, so these are sets of issues 15,17,18,19. Rather than just throw them out, I'd rather give them away to anyone who wants a set. All I ask is that you pay for the shipping and PayPal fees. This comes to US$3 for shipping to the US by surface mail (cheapest option), or by Airmail if you live in Europe. If you live in the UK, the price is £1.25 (by PayPal). Because I only have a limited quantity, please e-mail me first if you want a set. You can then send the shipping cost through PayPal. E-mail: dgs@clara.net

Dean Garraghty

->There are always shell accounts too. I have heard that they are no
->longer being offerred by a lot of services.

I haven't bothered to confirm this with my ISP (mainly because I
don't want to hear the bad news), but I suspect that what's going
on now is that when I *think* I'm using Unix shell mode (like right
now, e.g.), what's really happening is a *simulation* provided by a
service called www dot shellaccess dot com, which my ISP is apparent-
ly subscribing to as opposed to providing the real thing. This could
also explain why I can only "access" this pseudo-shell mode by direct
dialup to my ISP. In any case, there are few Unix shell users left
these days (unfortunately).

Hi all,

I was wondering if anyone had Rana 1000 manuals online. I'm looking
for the dip switch settings on the back of the drive and what they do.

Also would like to know how to access the diagnostics on the drive and
what the codes mean.

Rana 1000 problem:
Unit gets power. display works, replaced bad switch panel with mini
push buttons (the internal ribbon broke). However, the drive doesnt
spin. The motor doesnt run when turned on. cant tell if there is power
going to the motor or not. I get power at the 5 & 12 regulators.

Any ideas?
Rory

A few years ago I'd heard of a 65832 which was supposed to be program
comatible with 6502 / 65816. But I never looked into it in more detail so I
dunno if it was real or readily available.

True. For that matter, there are TCP/IP stacks and various Internet
access tools for DOS, even including Web browsers (check out Arachne at
http://www.arachne.cz, for instance; it's supposed to run on an 8088
CPU). For that matter, there's a guy who claims to be working on a TCP/IP
stack and Web browser for Atari 8-bits -- check
http://members.tripod.com/~morloc/page5.html for details. (AFAICT,
there's no actual code yet, and I'm skeptical that anything useable will
come of it, but who knows....)

In any event, the "capable of Internet access" (or "could do the
internet," as Lee put it) criterion is a poor one when it comes to Atari
disk access. The capability to read FM disks is a function of the disk
controller circuitry, which is in the motherboard chipset on modern x86
systems. It's present in at least some moderately recent chipsets, as I
and others have said. I can't promise that it's available in all, or even
in any, chipsets being sold as new today. At worst, it should be possible
to add it to any system with an ISA bus by adding an old floppy
controller card. I don't know if such cards exist for the PCI bus,
though.

Though based in Maryland, toad.net had dialups in California. Their servers are Linux-based and they supply shell access too. We switched to them from Earthlink and I only wish I could've done it sooner. You can call and get a REAL tech when you need something.

www.toad.net

When I first started with Netmagic I even had access to the gnu C compiler
from the shell account. I never really wrote anything sophisticated using
it, but it was nice to have. Now I don't even have excecute privilages in my
own space and no access to the compiler. I'm not even sure if I can run
"tetris for terminals" anymore.

I do see the 'modern' need to restrict people from having full access like
the old days. The only thing I use my shell account for now is file moving.
The extr $5/month for shell doesn't seem worth it to me right now.

## 36. Rana 1000 Settings

Newsgroup: comp.sys.atari.8bit

Sorry for the Html stationary. This is the only document I have for setting the rana drive letters.

Good luck with your Rana 1000. The online Atari sites might have the Diagnostics information. I do know that both 3&4 switches up enters diagnostic mode and pressing the front ID touch button will cause something to happen..

Just had to say it -

I just downloaded a DiskJuggler image of Atari800DC with tons of roms.
I have a real 800xl, it's cool, but dayuuum, it's neat on the
dreamcast. Hooked up to my big TV, supports the dreamcast keyboard,
it's just plain 'ol neat.

Shellaccess.com is a real shell account. I don't know if it makes a
difference that you are in Cincinnati, but I can access my account by
dialup or telnet. Iglou has had "shellaccess.com" as an alternate name
for years, and as far as I can tell all that has changed is that now
the shell server only uses the "shellaccess.com" name.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

## 42. Linux envision utility

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-02 11:18:43 UTC
From: Larry Richardson <rich5462@bellsouth.net>
Message-ID: <jmVQ9.39939$nc7.18594@news.bellsouth.net>
Source record: 24355

I have been writing a Linux version of the envision utility, more or
less. If anyone is still actually writing multi-color character
displays for Atari 8-bits, they might find it useful, even in this early
state.

http://bellsouthpwp.net/r/i/rich5462/genvision-0.1.tar.gz

See the README. It uses GTK, and compiles under RedHat 7.1 just fine...
I haven't tried it on other Linux OS flavors. Just run the ./configure
that's in the tar ball, then 'make'.

There is an A8 emulator that runs on the dreamcast? I didn't know that existed. I'll search on the Atari800DC, but are you aware of any other links? These emulators are showing up everywhere! PC's, Mac's, PDA's, and now DC.

I'm pretty sure we never got around this either.

I've also never found an original copy of the game, despite being on the
lookout for many years. Do you or does anyone have one for sale?

> marginally and if its a big file or in the wrong place on the Atari disk
> it won't do it all unless you can make a copy of the disk and swap that
> one in at the appropriate time.

My MyUTIL experience regarding whether better to format the disk with the PC or
with the Atari has been more mixed than that. I can recall where it sometimes
seemed to make a difference, but I know I've had plenty of success either way.

Here's some MyUTIL advice already in the FAQ on this particular topic:

Hans Breitenlohner:
2. If the PC drive is a 1.2M drive there is the additional problem of the
track width.
The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo sums it up this way:
So a basic rule of themb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of
course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

> MyUtil (PCXFer) is the only program that can read Atari formatted disks
> with the above restrictions and that is using DD only.

There's also the newer AtariDsk by Hiassoft, available at
http://www.horus.com/~hias/atari/

I've never tried AtariDsk (being perfectly content with MyUTIL), but people
have said it's a big improvement over UTIL/MyUTIL, though with basically the
same capabilities.

> Turns out its not the drive - its the controller.

Point taken, thanks.

Anything goes nowadays as long as there's a C compiler for it. Just the
other day my boss suggested that my server budget be hacked and that I
buy two Playstation 2's on which to run Linux and Samba.
;)

Hi,

There is a Basic Java Atari 800 emulator (enough to allow Graphics 0 Basic Programs) at the following location:-

http://www.atari800.info/cms.php

For those that are interested, there is also a Java Acorn Atom Emulator.

Bye

I finally beat it afer about 30 tries. I figured out the right startup mixture and how to adjust it as the game went on. My big problem wasn't the metldowns but downtime for repairs. If I damaged anything I gave up and started over with a different mixture tweak.

Too bad that game is all text-based; The graphics are only used for the docs. someone should rewrite an all-graphics version that uses the light pen for input! :-)

Ultima 4 for the Atari 8-bit had no music, which is very dissapointing for me
after playing Ultima 3 on the Atari.

Ultima 4 was also the last version released for the Atari 8-bit.

Right now I think the best you'll be able to do is the 65816. However, why
is it being 15 years old such a problem? They're made by Western Design
Center, who says they'll be making them for a while.....

Personally, I'm using a M38049 from Mitsubishi which is 6502 code compatable
in my small projects... (no external ROM or bus though :( ) 62K of
flash though :)

For that many keys(all except function),one of the biggest problems with keyboards is that the silver contact trace tarnish is not cleaned and sprayed with lacquer early. If the traces are black, try cleaning them gently with a silver cleaner. An ohm meter can tell if the traces are open.

Also, the keys except the function all go thru two MC14051(4051) scan chips. If either are dead, then the whole keyboard will fail. You can work backwards to Pokey.

I wrote a program for the A8 a long time ago that "detonkenized" a basic program. Not 100% done or user friendly, but helped me many times.

I am sure if you searched A8 program libraries for de tonkenizers, you'll find some there as well.

Being an old cpu isn't a bad thing..it is at least well developed. The big problem going to a modern cpu is that the architecture is different, support for 8 bit 6502 code may be marginal is at all..unless you run an emulator on it, then you are the point of costing a whole lot more than a cheap PC, and it has the hardware to run the isa/pci cards built in.

At least the 65816 can run in 6502 mode, and can run in an extended mode much faster than the stock 6502, plus access loads more ram directly. With todays imbedded chips, adding hardware to support some devices(hd, cd, usb) is a lot easier. Video is a bit more complicated.

Do you have the parts in hand? When I tried dealing with Mitsubishi I never got a human on a phone and they never returned my calls. It would be interesting if they started actually selling parts for a change.

Yep, there is a c compiler and a pretty well supported free library
called Kalistos er something...

I have a selfboot CD that has 800 nes roms on it with an emulator that
really rocks. DreamSNES is a Super Nes emulator that works great (a
little slower on some games though) - It even supports saving games to
the VMU... I can browse the web with it, watch Divx movies, Mp3's,
play CD's, Linux, etc - oh yeah, and there are those dirt cheap
Dreamcast games that look really good -
all for 39.95 -

It has 2600, c64, Amstrand, Apple II, etc emulators as well.
dcemulation.com is a good resource...

> Point taken, thanks.

Thank you for posting that accurate info on the 360k vs 1.2 meg drive issue - a subject that also belongs in the Atari to PC disk transfer arena. While Ataridsk _is_ a big improvement over MyUtil in ease of use, it does not read Atari formatted disks like MyUtil can. It also does not claim to, one must always format the disk to be used for transfers on the PC with Ataridsk first - no exceptions. One rather neat deal with these Ataridsk formatted disks is that they _will_ boot on the Atari system, but only on modified drives and they only show an Ataridsk title screen. Not of much use, but still a neat trick.

## 68. Looking of info on game.

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-03 06:24:24 UTC
From: gary_hackathorn@hotmail.com
Message-ID: <71e5a14c.0301022224.7c143647@posting.google.com>
Source record: 24381

I am looking for info on a game I played on the Atari 400.

The game involved training a "something" to move around a hexaganal shaped grid of dots. At each spot the thing picked one of the six new spots to go to based on what you told it. If it had never seen a particular situation it waited for the user to tell it what direction to go in. When it reached it situation it had been trained for it kept going.

I am looking for any information on this game. The name, the publisher or the author would nice.

I rember it had a data file that contained the training history of the thing that was 64 bites long. Each bite contained a number from 0to 5 that indicated the direction the thing went.

I am reading Wolfram's A new Kind of Science and rembered this game. It seems like a nice little program to study.

Thank You

> ly subscribing to as opposed to providing the real thing.

The only way I can imagine a shell access being legitimately described as a "simulation" would be if it were done by running a Unix shell on a non-Unix system, such as Windows. The http://www.shellaccess.com Web page says that they're using UltraSparc servers, so it seems likely that they're running "real" Unix, or at least something so Unix-like as to make no difference for most users (say, if they were running Linux).

If you're just disappointed that your ISP is farming out that service, then I don't see what the big deal is. Properly configured, it shouldn't matter where the server is or who's running it, at least within reason. (The latencies if the server were on the other side of the planet might be an issue.)

If they're requiring that you use some special software, then that's a bit odd, but doesn't say anything about the underlying platform. Of course, it could close the door to dial-up users on old systems like Ataris.

> This could
> also explain why I can only "access" this pseudo-shell mode by direct
> dialup to my ISP.

That's just firewall rules at work, or something similar (xinetd or TCP Wrappers can do this, for instance).

> In any case, there are few Unix shell users left
> these days (unfortunately).

Considered broadly, that's not true. If anything, the number of Unix shell users has probably increased in the past year -- Mac OS X is based on Unix, and comes with a command shell, so many of today's Mac users probably use a Unix shell at least occasionally. In terms of dial-up Internet access, though, you may be right -- PPP, and increasingly broadband, just make it too easy for people with more modern systems to

get on the Internet more directly, making shell accounts less appealing.

They're available thru Arrow and All-American..

Unfortunately, mitsubishi wants to promote their 16 bit parts in the US, so
that PARTICULAR part is supposed to be hard to get until Feb. Our latest
designs at work are moving into the M16c62-type micro.

At work we have about 100 pcs of the 8 bit parrt for an existing design, so
the parts are/were available when we bought them.

Source record: 24389

I just got a hold of a Pitfall cart for the 5200, and discovered that my 2-port 5200 console is apperently one of the units with the Pitfall incompatability issue.

Is there any hardware mod that can be done to the console to fix this?

At first, I had thought that the problem was the slight differences in the cart port pinouts between the 4port & 2port models, except that only "some" 2port models have this issue.

Grant LeTourneau's site with the Atari Field Service Manuals has been down for a while now. So I don't know where to go from here.

Even if it is no better then the 2600 version, I'd like to play it if I can.

If anyone can offer any advice, I'd appericate it. Thanx.

Check out PocketAtari at http://pocketatari.retrogames.com for PocketPC PDAs. Works great on my iPAQ, if a little slow at times...but I've heard that's just a failing of my particular model. Regardless of that, it's a damned impressive emulator.

It's stuff like this that makes me wish I had a time machine. How great would it be to go back to the heydays of Atari and show off a modern PDA running an Atari emulator to your friends?

I really need to get out more often...

Drek

## 79. Magazine clearout update - free mags

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-04 11:27:14 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1041679598.93749.0@demeter.uk.clara.net>
Source record: 24392

Hello All,

There don't appear to be many takers for a set of free mags as detailed in my last posting. I still have 14 sets of these things left if anyone wants any. Just to answer one question that has popped up, I can only accept the shipping cost through PayPal on these. Cash costs too much to convert on small amounts (You send $3, the bank charge a flat fee of $5 to convert to pounds, the net result MINUS $2 - not a good idea!!). So, PayPal only please. Here's the original post with details:

I've been clearing through some items today, and discovered 16 sets of my old DGS News-Paper printed magazine that were published around 9 years ago. We published on paper for 5 issues, but issue 16 sold out years ago, so these are sets of issues 15,17,18,19. Rather than just throw them out, I'd rather give them away to anyone who wants a set. All I ask is that you pay for the shipping and PayPal fees. This comes to US$3 for shipping to the US by surface mail (cheapest option), or by Airmail if you live in Europe. If you live in the UK, the price is £1.25 (by PayPal). Because I only have a limited quantity, please e-mail me first if you want a set. You can then send the shipping cost through PayPal. E-mail: dgs@clara.net

Ok. So now I got the schematics out. I've tested the traces, and the resistance between the key contacts - and the voltages up to the '4051' ic chips. That looks good. I am not sure what you mean by testing backwards to Pokey. I know where the pokey chip is and how the 4051's connect to it, but as I haven't taken any electrical courses (yet = all self taught) but I am dying to learn. Can you give me any hints on how to test the 4051's? Meanwhile I am going to try and find some to buy as I think they might be the culprit.

Thanks!!! This is fun.

This is a fairly easy mod, it just involves removing the bios chip from a non-working 4-port (or finding a replacement bios chip with the 4port bios rom on it) and swapping out the bios chip in the 2 port, once you do that your 2 port will play all the games and still be compatible with the VCS adapter. Check out this thread at AtariAge, 2nd post has the easy instructions:

http://www.atariage.com/forums/viewtopic.php?t=10279&highlight=port+bios

also check out the 5200 FAQ for more info on the differences in the 5200 systems:

From: Dean Garraghty <dgs@clara.net>
Message-ID: <1041761298.34533.0@despina.uk.clara.net>
Source record: 24304

Hello All,

There appears to be quite some confusion over the free magazines I'm giving away. It appears people have no clue what they are, or who I am. Having spent literally thousands of pounds on advertising, promotion and exhibitions/shows over the years, this makes me wonder why I spent so much!! Here's some questions answered:

1. Yes, they are free. The $3 JUST covers the shipping cost.

2. No, they have nothing to do with Atari themselves.

3. DGS is Dean Garraghty Software, which is the company name I have used since 1988 to sell Atari products. It is not the actual name of the magazine.

4. The magazine is called the Atari 8-bit News-Paper.

5. Yes you can see them, click here to see a picture: http://www.dgs.clara.net/4MAGS.jpg

6. The other issues (including the disk-based issues) can all be found on our CD-ROM, which also includes all the PPP software too. Go to http://www.dgs.clara.net and click to see the CD-ROM info.

7. No, you can't pay the $3 in cash. PayPal only please.

Hope this clears things up. If you want a set, please e-mail me first: dgs@clara.net

There's been some work (including some of my own) getting 'Atari800'
to run on higher end PDAs like the PocketPC and Sharp Zaurus.
(I have the latter; it runs Linux! :^) )

>-->David Pochron dpoch@ticon.net

I played 1-3 on the Atari 8-bit and 4-6 on the Atari ST. Ultima 6
on the ST was ok as a game, but moved very slowly. I kind of
sensed that this would be the last Atari version of the game. I
have 7-9 for the PC, but have not tried them out as yet. Ultima IV
was actually the best of the versions I have played...

I believe we have had two; FTE and Dataque.
>
> I think , there should be a new ATARI XL/XE system , too.
>
> Based on a 65816 , must be compatible to old ATARI 800 XL/XE software.

So we replace a ~25 year old processor with a ~20 year old processor?

Much as I like the 8 bits, they followed a bad business model. Some of the concepts like difficult or no upgrade path just died due to technical Darwinism: i.e. You stick a 65816 in an Atari today, what are you going to put in it in 10 years?

Going to be hard to compete on hardware prices with ~slave labor being used to produce IBM type hardware.

What's the "Killer app"? In 1979 it was Star Raiders. Even if you come up with a must have app, what is going to keep people from writing the same app for everything from Linux to Windows?

Understand that I do believe there will be new technologies that come out and are sucessful. The whole cell phone market with LCD color displays is a good example of a new computer with a killer app.

As I remember it, the 1027 had its own power supply, which was totally different to all the others. I think it was a 12V output.

I suppose there are two routes.

One is the emulation/hardware link combi route with emulation software configures to work with a PC card which can run compatable disk drives, and maybe have a SIO plug and a pair of joystic ports at the back. Then all one would have to do is supply an old P100 machine no one wants any more, plug in the card, connect the floppies to it, install the drivers and software, and off you go.

The other is maybe looking at what V-Tech and the like are doing with starter/preschool computers (I've heard at least one version of these machines is Apple ][ Based) and doing simmilar, but as well as a usb port, include an SIO port and the cartridge port for those plug and play apps, utilities etc in a simmilar pre-school/word processor home user package.

Alternatively we can just accept that these machines have had their day as a comercial viability, and continue to enjoy them as is. And support those 3rd party cottage industries that have grown up around them. Which is what i feel is maybe the only reliable and sure way to go.

Many people have tried to resurect older formats, introduce home entertainment systems and the like. All have failed. The only people who

seem to be making money shipping old equipment are those making those pre-school/early learning machines with the possible exception of those Brother PN-9000 laptops. Maybe thats the only viable market, and maybe that markets at capacity already. But they have done some good machines with in-built GUI environments, word processors and other utility software. Some are lap-top/notebook wannabees with tiny LCD screens, but i have seen one (the best in my opinion) that plugs into a TV for display. The GUI on that reminded me of GEOS (and proberbly was derived from it). Something simmilar, that could take atari cartriges, and an SIO port as well as a USB/parrellel/serial connections that could run Atari 8-bit software may benifit from a double market. But someone brought out a home web browser some time ago which had built in C-64 emulation (allegedly, apparently not much cop) and that went belly up and hit the bargin bins pretty damn quick. So maybe thats a bad portent that we should just leave well alone.

But those are just my thoughts.

## 103. FA : Many boxed (new) ATARI XEGS carts like Thunderfox,Airball,Battlezone ...

I have many boxed , new ATARI XL/XE cartridge games on ebay , look at
:

Airball :

http://cgi.ebay.de/ws/eBayISAPI.dll?ViewItem&category=3528&item=1949675794

Thunderfox :

http://cgi.ebay.de/ws/eBayISAPI.dll?ViewItem&category=3528&item=1949675389

Rescue on Fractalus :

http://cgi.ebay.de/ws/eBayISAPI.dll?ViewItem&category=3528&item=1949674839

Battlezone :

http://cgi.ebay.de/ws/eBayISAPI.dll?ViewItem&category=3528&item=1949676107

Gato :

http://cgi.ebay.de/ws/eBayISAPI.dll?ViewItem&category=3528&item=1949676382

Crossbow :

http://cgi.ebay.de/ws/eBayISAPI.dll?ViewItem&category=3528&item=1949676644

Crime Buster :

http://cgi.ebay.de/ws/eBayISAPI.dll?ViewItem&category=3528&item=1949676830

Lode Runner :

http://cgi.ebay.de/ws/eBayISAPI.dll?ViewItem&category=3528&item=1949677248

Ace of Aces :

http://cgi.ebay.de/ws/eBayISAPI.dll?ViewItem&category=3528&item=1949679266

and more :

http://cgi6.ebay.de/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=klassische-videospiele&sort=3&page=5&rows=25&since=-1&showpics=1&stab=0

I can ship worldwide and all my carts are NEW , factory-sealed and
work on NTSC and PAL systems , all games with ENGLISH instructions.

I also have lots of ATARI 2600/7800 games !

Mathias

Thanx for the link.

I already had the rom image thou. It's just a matter of getting it on a chip for use in the console. Almost be easier to find a 4port 5200 unit to strip then to find where I packed my eprom burner. ;)

In lieu of the fact that I dont have any 25xx series erpoms, guess I'm going to have to use a 27xx and 7414 inverter. Nothing simple is ever easy, eh. :)

## 106. FS: Lot of Stuff - Chicago Atari Users

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-06 01:11:45 UTC
From: Rob Knautz <knautzr@removemeyahoo.com>
Message-ID: <Xns92FAC3C3CC79Arobknautzcom@199.184.165.241>
Source record: 24319

Hello...

I have a large quantity of Atari stuff which I would like to pass on to a local (Chicago, IL) fan. I will be moving in a few weeks so my time is limited to prepare shipment except for anyone who might want to pay for pack and mail services which would be quite expensive. Someone would need to pick this up in downtown Chicago (Wrigley area) or I could possibly drop off on the northside/north shore. Asking $150 for the lot OBO by Midnight, Sunday January 12th. I reserve the right to keep if no acceptable offers are made. I would prefer to not split at this point, but if I get no offers, I would consider doing this next week.

Here's a quick list of the inventory and a link to pictures:

http://www.knautz.com/atari/atari.html

2 x Atari 1200XL (worked the last time I tested)
1 x Atari 800XL (worked the last time I tested)
1 x Atari 800 (worked the last time I tested)
1 x Atari 400 (48K upgrade - worked the last time I tested, but the case is in very sad shape)

5 x Atari Power Supplies (none cracked to repair fuse)
1 x Atari 800 Power Supply

2 x Atari 1050 Disk Drives (no idea if these work)
1 x Atari XF 551 Disk Drive (worked the last time I tested)

1 x Atari XM301 300 baud modem (worked the last time I tested)

3 x Ape-Face Parallel interfaces (never could get one to work, but I had no documentation) (I will also throw in a Panasonic 24pin dot matrix KX-P2123 printer).

2 x Gemini GemSticks
1 x SpectraVideo Joystick
2 x Wico Command Control joysticks with all three handles for each

9 x SIO Cables

16 cartidges (some notched to fit the 400):
Basic Rev A
Star Raiders
Pac-Man
Qix
Krazy Kritters
Centipede
Kickback

Soccer
Donkey Kong
Gorf
Asteroids
Galaxian
Jumbo Jet Pilot
Buck Rogers
Unlabeled, can't remember what it is
Atariwriter - with Books, but not cassettes

Bunch of Disks and bunch of books as shown. Not pictured is a beat of copy of the 400/800 basic reference guide.

Please send email to knautzr at yahoo.com with questions or offers.
Chicago buyers preferred without prior consent.

## 109. Sparta problem: loading to XMS

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-06 08:14:29 UTC
From: Kuba Kosiec <lewis@atari.pl>
Message-ID: <avbdto$a61$1@news.tpi.pl>
Source record: 24322

```
How to load data to extra memory under SpartaDOS X?

If I use batch file like that:

poke $d301 $ef
load bank1.dat
poke $d301 $eb
load bank2.dat
poke $d301 $ff
program.com

everything works OK
After linking it to file with this structure:
d301-d301 -> here $ef
4000-7ffff -> bank1.dat
d301-d301 -> here $eb
4000-7ffff ->bank2.dat
d301-d301 -> here $ff
2000-3000 -> program.com
2e0-2e2 ->run at $2000
computer hangs up.
SpartaDOS works in banked mode. I think this is problem, that at loading
bank1.dat and bank2.dat $d301 register is changed by system to $ff or number
of bank used by Sparta (additional: how to check what bank Sparta uses?) and
files are loaded to main RAM, not to extra.
Help me: how do this? TIA!

## 110. ABC Basic Compiler

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-06 11:06:21 UTC
From: Jindrich Kubec <kubecj@asw.cz>
Message-ID: <3E19632D.A972418E@asw.cz>
Source record: 24323

Hi,

yesterday I've tried to play with ABC Basic Compiler from Monarch
Systems. I've got the reason why I want this one (not MMG or Datasoft).

But I failed completely. I've tried it under two different versions of
Atari800 emulator (including the latest), but it was still same:
'COMPILATION ABORTED'. I've tried it with/wo basic, with/wo os patches,
OS/B x XL, still same.

I've tried 1.02, 1.03, 1.05

Could somebody, please, provide me with:
1) Working ATR
2) Instructions
3) Sample basic program which compiles - the shorter the better.

## 111. Re: help! software for disk drive xf551 modified in 3.5

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-06 12:19:31 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3E197453.5E6F0E00@students.uni-mainz.de>
Source record: 24324

Well,
1) setup a 5,25" drive as drive 1 and the 3,5" drive as drive 2.
2) Now boot sparta DOS or MyDOS on drive 1.
3) Next configure drive 2 as DSDD, 80 tracks (MyDOS option O and P,
Sparta not nescessary!), then insert a 3,5" disk into drive 2 and format
drive 2 (MyDOS option I, format; sparta: load Format.COM and choose the
proper density);
4) Next write MyDOS DOS/DUP files onto drive 2 or simply copy the
SpartaDOS X...DOS and Boot.COM onto drive 2.
5) Then switch off drive 1 and setup drive 2 as new drive 1 (change the
DIP switches!); don`t switch off the computer !!
6) With MyDOS simply reboot (M E477 RETURN)- you should now have a
bootable 3,5" MyDOS disk.
7) With Sparta load the file Boot.COM from the 3,5" drive with BOOT
X32x.DOS (where x refers to the sparta version number, e.g. X32d.DOS or
X32f.DOS, etc.), which will install a bootdriver for sparta-dos. When
done, reboot (RUN E477), you should now have a bootable 3,5" spartados
disk... I hope I did not forget something. Good luck! -Andreas.

## 115. sep. Antic access...

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-06 13:05:41 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3E197F25.9E8A0120@students.uni-mainz.de>
Source record: 24328

Hello Folks,
here a short question for the Atari professionels:

One Atarian told me that sep. Antic access would only
be possible on XE-computers and NOT on XL-computers, because
one needs the Freddy/Freddie chip and the Gate Array Logic
chip, which can only be found on XE type computers. 65XE and
800XE computers can be upgraded with the Gate Array or a
similar chip, XL computers cannot - unless they have a Freddy
chip. The Gate Array is required for the sep. Antic access,
alas the Gate Array chip is controlled via the Freddy chip...

And now the question: Is this true ?!? Is the sep. Antic
access really limited to the XE computers ?!? Is it not
possible on XL-type computers ??? -Andreas.

Read this thread on AtariAge
http://www.atariage.com/forums/viewtopic.php?t=11452&highlight=incompatibility.
There are apparently 3 games that are incompatible with the 2-port
5200: Pitfall, Mountain King, and Krazy Shootout.

## 117. atari++ web download

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-06 14:31:22 UTC
From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <avc3vq$eds$1@mamenchi.zrz.TU-Berlin.DE>
Source record: 24330

Hi folks,

the atari++ emulator has now a home page where you can find and download
the latest releases of the emulator. Here we go:

www.math.tu-berlin.de/~thor/atari++

BTW, a 1.13 of the emulator is now available (see CVS snapshot on this
page). New features are cartridge support for SDX, XEGS cartridges, and
the RTime-8 real-time clock pass-thru cartridge. It also contains a number
of bug fixes.

So long,
Thomas

Message-ID: <y6hS9.38519$yN1.27382@news.bellsouth.net>
Source record: 24333

He's right on that. All I can offer is this:

Traces which have been pulled up (and this is really easy to do on XE machines in particular) suffer from a couple of problems when it comes to the obvious idea of reattachment.

First, how the heck do you 'glue' the trace back down, and even if you succeed in doing this, how then to reconnect the trace with it's proper pad? In short, don't bother.

Leave the old trace where it is and run a jumper wire to replace it's function.

There is another way though. I've used it to repair the mylar keyboard underlays on my xe machines. It is a product called NICKEL PRINT. Basicaly, it is a clear paint with a ton of nickel particles suspended in it. You can literally paint a trace with it. Once dry, it is very conductive.

Finding a brush that will draw a fine trace is nigh impossible. Here is another McGuyver solution I found for this:

Get a book of matches from your favorite bar and take one out. Cut the base of the match off at a 45 degree angle. Use this point as your brush. Once the match end starts to get clotted, cut another one and keep going with it. Keep something pointy such as the tip of a steak knife handy to scratch away overflow before it dries completely. I always thought a dental pick would be useful for this, but the point of a knife does work.

As for DE-soldering, here are a few tips to help you do a clean job the first time round. This is hard-won information.....

DON'T use one of those desoldering 'pens'. DO use a desoldering BULB. Radio Shack sells them and these DO work in addition to being much cheaper. Why? Because you can both suck solder and BLOW solder out with one. Let your iron heat up for about 1/2 hour so you'll know it has all the juice it can have. Put it's tip on the joint you want to clear and wait about 1second. Then, while still heating the joint, suck with the bulb. Examine your work. If it isn't totally clear, heat and BLOW with the bulb. Once a joint appears completely clear, try and wiggle the pin that is in it. If it wiggles, the joint is clear and you can proceed with the next joint.

BTW, desoldering is a heck of a lot harder to do that soldering and a heck of a lot harder on the device you are removing. Don't EXPECT a device you removed to work again. It may, but you've put it through a lot so have spares on hand.

If you want to 'farm' old boards for spare parts, there is a quick way to
remove all of them in one shot. Heat the bottom of the board with a propane
torch. When the board is basically on fire, whack it on a handy surface.
The components will jump straight off the board. Mostly this is good for
discretes (caps, resistors etc), but chips might even survive......

Regards,

Jeff

To the best of my knowlege, what Freddy does is allows Antic to access the 64k above the base ram at the same time the processor is accessing base ram. Without Freddy, Antic can't access ram above FFFF IIRC.

I saw a gal/pal programmable replacement for Freddy somewhere on the web. A page showed how to create one out of non-atari-specific parts. You sure can add a freddy to any Atari8 making it compatable with the XE memory scheme in all respects. Of course, if you add a Freddy to a 400/800 you won't have full compatability but it would make for a nifty project. The only Freddy-equipped non-XL/XE on the planet. Hmm...

Chris wins a cigar!

You can also use the 1027 power supply on any 9vac Atari computer or peripheral such as the 1200xl or the 1050 disk drive. You won't be pulling anything like what the brick can deliver, but it will work just fine. I know, you're thinking about that extra half-volt. A half-volt is nothing. Three volts over is still legal. Anything over three volts above spec is not reccomended.

This doesn't work in the reverse. DON'T try running a 1027 on a standard 9vac Atari brick. It pulls way too much juice and will pop your power brick. Then you'll have to cut the brick open and replace the concealed fuse which is a big pain in the butt.

Jeff

I bet the Ape Face's work. I think why you couldn't get them to function is that the 1200xl is the only Atari8 that was specifically crippled for devices which pull thier power from the sio jack. There is a simple hack to enable power to the sio on the 1200xl.

Regards,

jeff

WORMS has God's OWN copy protection. Short of a laser-cut hole in the disk
you can't get much better. My Super Archiver II with Bitwriter will copy
it, but not much else will.

Regards,

Jeff

What's a Super Archiver II + Bitwriter-equipped 1050 disk drive worth these days? I've never seen another one. Mine came from a friend who borrowed a bunch of gear when he was in the Navy and had it stolen. He sent this drive to me along with some other stuff to make up for my loss....

Regards,

Jeff

## 131. Robotron 2084 programming

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-06 18:20:55 UTC
From: Bill <kinetic9130@yahoo.com>
Message-ID: <3E19C907.5010505@yahoo.com>
Source record: 24343

I was playing Robotron 2084 on an emulator the other day, and became curious as to how the programmer manipulated more than five shapes (4 players + 4 missiles as a player) at the same time. Am I looking at what amounts to character set graphics? Bit map routines? Muxing players on the VBI?

Could be time to drag out the disassembler...

Bill

Untrue. Freddy is just replacement of few discretes regarding memory
muxing/clock dividing.

> I saw a gal/pal programmable replacement for Freddy somewhere on the web.

I doubt that.

> A page showed how to create one out of non-atari-specific parts.

Closer, such scheme is on my page, but is not 100% correct, I think.

> You sure can
> add a freddy to any Atari8 making it compatable with the XE memory scheme in
> all respects.

No, you need C025953 for that.

See http://www2.asw.cz/~kubecj/achemmu.htm
See http://www2.asw.cz/~kubecj/achfredd.htm

EMMU sends CAS to CAS of one of the banks (64k main, 64k extended).
Processes A14 & A15 and sends back to freddie (into muxer) RA14 & RA15
depending on setting of BA14/BA15 (PB2,3).

Also takes care of PB4 (cpu) & PB5 (antic) and HALT line and selects the
apropriate bank.

Just a few GAL equations (except for that goddamn MHALT line - Mathy,
where's that simplified GAL???)

My conclusion is that it may work on XLs, but maybe HALT/MHALT timings
would be the problem.

I don't have it in front of me, and I've been wrong about this before
(Itay set me straight WRT Joust), but from what I remember deducing,
I think they were just blitted pixels or IRG characters, for the most part.

I don't remember it being 'colorful enough' to really look like any/many
player/missiles were used...

I'm curious to know, though!

## 137. 220/110V

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-06 22:37:36 UTC
From: lbaeza@usa.net
Message-ID: <c860ca33.0301061437.7b6bfd17@posting.google.com>
Source record: 24200

Supose you live in North America and you own some Atari hardware:
a nice 800XL, two 1050 disk drives, one 1010 program recorder,
and a 1027 printer.
Supose you got a new job in Europe, and you must live a whole year
in there. You take your Atari stuff with you, to entertain yourself and
make that raw long winter a little bit more warm.
Besides the NTSC/PAL problem you may find, there's another problem.
You'll guess all your Atari PSUs were made to be used with 110V AC and
not with 220V AC!

So... what do you do? You buy a 220/110V adapter (transformer)
to use that original Atari PSUs and don't throw'em to the garbage.

My question is: what specifications should have this 220/110V adapter,
so you don't blow away all your precious Atari hardware?

Output: Volts? Amps? Watts?

Note: all the Atari PSUs (computer, drives, recorder, printer)
would be connected to the 220/110V transformer at the same time.

## 138. Re: 220/110V

Something that could be done is:

Contact some atarians in Europe the can help out when you are here, secondly
rebuild everything to use a normal pc power supply most of them can switch
on the back from 110V to 220V....

Atari's mostly run on 5V and drives on 9V so finding a new power supply
overhere in europe isn't that hard.

Where do you want to go in Europe?

Source record: 24203

Hiya, Jindroush.
I didn't get as far as you did in atari800 win plus 3.1.
It gave a notice of 'you have crashed a800'.
I had better luck with xlit (.2 I think.). If I turned off
the high speed i/o patch, I could get a BASIC program
to start the compilation. However, it always trashed
the source disk and couldn't complete the compilation.
I've used ABC, so I know how it should behave.
ABC is very timing sensitive, because it is doing writes
as it compiles, then reads of what it has written.
Under xlit, it isn't writing properly, it is trashing the VTOC
I think.
Regards,
Rambling Russg
(I used my own patched 1.03 and someone elses 1.05.
Both did about the same.)

FAQ with the power details here:-

http://www.faqs.org/faqs/atari-8-bit/faq/

Display? May be able to get away with a custom made Atari monitor jack -
Scart/Peritel lead plugged via the socket at the back of most modern
TV/Videos. Note its the same connector, just its called Scart here in the
UK, and the rest of Europe calls it Peritel! Its what we have here in place
of S Video which is common in America. It effectively lets you use a TV as a
monitor. I belive it works with compisite video output of the Atari.

Can anyone confirm it has worked? I've not tried it as i have an old (but
good) colour TV and a Commodore 1084 for my displays.

Note, France has SECAM, every where else uses PAL. Secam is just like Pal
but the colour encoding is different (so PAL will give a crisp black and
white picture on a Secam set). Why did the French choose a different system?
Because they they like to be different, and they can!
Many TVs these days have Scart sockets, A fair few will look at an NTSC
signal and display it properly. But thats uncommon and depends on branding
etc.

I've noticed that Best have Pal Motherboards (populated) much cheeper than a whole PAL console. That may be another possibility.
If your going to the UK, don't bank on picking one up cheep, Ebay.co.uk will be your best (and possibly only) bet (the atari 8 bit ranges were only ever at best a poor No4 seller in the UK after Spectrums, Commodore 64s and Amstrads) Most Thrift shops will NOT trade in electrical goods due to laws governing electrical equipment (2nd hand stuff must be tested and approved by a qualified electrician, most don't bother and just chuck the stuff). I understand in Europe thay are Much more common.

## 142. site update - data32 will now show you each directory on a CD

Newsgroup: comp.sys.atari.8bit

Howdy folks

I updated my site:

- Data 32 will now allow you to view each directory on a CD
- A version of Quadro for the multijoy interface has been added
- the Multijoy section has been renamed multijoy (was: multijoy8). Please change any links you might have to this section.
- the bugs and feature list now shows you which bugs have been fixed already. (if you don't like the yellow text, please make a suggestion for another color.)
- MyDOS 4.53/4 has been added. (I found a 300+ sector ATR that became a 47 sector DCM. I like DCM!!!)

You know, I was thinking ( that was what all the smoke was about).

I'd consider getting a European Atari and drive once you get there. It wouldn't cost all that much over what it would cost to bring your whole system and buying a chunky 220vac adapter for your 110vac gear....

Regards,

Jeff

I've wondered about that as pertains to the Atari version of Gauntlet. All those ghosts....

I think Gauntlet must have been implemented in software. When there are a whole lot of badguys on screen it slows down quite a bit....

regards,

Jeff

Nope. I tried it right now, nothing happened. But in the meanwhile I
found working 1.02.

Do you know what are the differences between 1.02, 1.03 and 1.05?

Also, do you have any manual for it? I've got now working 1.02...

General question:
I know of these compilers:
ABC (monarch)
Advan (advan)
Basic Compiler (datasoft)
MMG (Special software systems)
Turbo Basic Compiler (happy computer)

Which of them is/was
a) best
b) most popular

If there is source code available, it should be possible. Even better is to
also have a specification sheet with timing values, etc. and all of the
commands the device recognizes. However, taking a raw PC driver and
converting it is, for all intents and purposes, totally impractical. Your
best bet would be to find a device that is supported by Linux so you can at
least get some source code to port over.

The thing is I really do have a lightpen for my Atari - a PC lightpen I converted. Actually the conversion consisted of simply cutting the modular plug off the end of the cable and replacing it with a 9-ping plug with the proper connections and the thing works like a charm!

A lot of games used GR. 12 or 13 type characters. The pixel size is
identical to GR. 7 160x192 four color mode which is the same res as P/M
graphics but with an extra color.

(three questions: what differences, 1.02, 1.03, 1.05,
Do I have manual (yes, for 1.03), which compiler
is best and which most popular (I think that's 4 questions).
Probably the MMG is more popular, and it supports
floating point numbers, I think. Personally, I prefer
ABC, I don't remember why, maybe because I could
use it better, compile with fewer errors.
MMG disk must be write protected, it will write to
the program disk, probably a copy protection thing.
Since you have gotten 1.02 to work, on a800 emulator
I guess, I guess you're off and runnig. Remember ABC
won't do any floating point functions (sin, ^, RND, etc.)
There were some bugs that each version fixed, and
other improvements. 1.03 is supposed to load from
DOS if the program disk is in drive 2 and your source
disk is in drive 1.

Alternaive: melt a roll of solder into a frying pan. place the board you
want to farm into the pan, so hat it "floats" on the pool of solder. now,
simply pick the parts straight off the board - as long as their leads aren't
bent at wierd angles, parts will pull off with very little effort.

I used both ABC 1.03 and MMG quite a bit back in the days and overall I
preferred MMG. I seem to recall ABC handling some ML code stored in strings
(i used to do that a lot) better than MMG. In 1999, I updated a lot of my
old HDTOOLS and compiled them all with MMG... even the old ones that were
originally compiled in ABC.

:>curious as to how the programmer manipulated more than five shapes (4
:>players + 4 missiles as a player) at the same time. Am I looking at what
:>amounts to character set graphics? Bit map routines? Muxing players on
:>the VBI?

my officemate, judy bogart, wrote most of robotron for the 400/800 during the spring/summer of 1983. i helped a fair amount with the design, but she did most of the work (she was kind enough to give me a portion of her "ship it" bonus check)

robotron was bitmap graphics using mode $D (it might have been mode $E). i don't recall the exact resource allocations, but i'm pretty sure that the missiles were hardware missiles, and that the "prot" controlled by the player was several hardware players.

there was a "killer" color (yellow?) in all of the robots, and the h/w collision detection was used to detect death. there might have been a "friendly" color (blue?) that was used to trigger boundary-box detection for picking up people

it always seemed to me that it was possible to do a decent game on the atari 400/800 without resorting to player/missile graphics, and that once you had a nice, solid strategy for doing without the extra hardware, you could add the P/M graphics back in and make a really nice looking piece of software. making people guess how you used the hardware resources, that was fun :-)

Hi,

> Do you know what are the differences between 1.02, 1.03 and 1.05?

Some bug fixes. The first version did not support DRAWTO correctly
(sometimes picked the wrong color), and later versions also came with
improved pseudo-codes for variable reference, making the compiled code
shorter.

> I know of these compilers:
> ABC (monarch)
> Advan (advan)
> Basic Compiler (datasoft)
> MMG (Special software systems)
> Turbo Basic Compiler (happy computer)

> Which of them is/was
> a) best
> b) most popular

I'm aware of the ABC compiler, the MMG and the Turbo Basic compiler.

Some facts:

ABC does not compiler to machine language. Instead, it creates a p-Code
that is interpreted on run time by a 4K large interpreter library that
gets linked to the code. Furthermore, it only supports integer arithmetic.

The ABC compiler was commercially quite popular; games like F15-Strike-Eagle,
Soloflight and Cavelord are to a major part written in basic, and compiled
with ABC. The funny thing is that, due to the p-Code, you're able to
de-compile these games again (unlike what is stated in the manual, this
is easier than with a true machine-code compiler). As a humorous side remark,
ABC itself is written in BASIC, and compiled with itself.

MMG compiled to real machine language, though I haven`t made enough experience
to comment on its quality. It does support floating point, but since it
uses the ROM based math-pack, the float support is almost as slow as the
float support in BASIC.

The Turbo Basic compiler also compiles to machine code, but this code
consists mainly of a lot of "JSR" to the run time library code. The compiled
code runs fast, also due to the custom floating point math in the library,
but also requires the custom run-time loader; you could not "link" the
library with the file into a single binary. Besides, the run time lib was
rather large compared to the interpreter of the ABC compiler. The compiler
had a couple of "flaws" as well. Some commands did not work correctly

("DSOUND" is flawed, USR() is buggy), and some basic constructions could not be compiled at all.

So long,
Thomas

Just about everything, but most likely the CPU (6507) is defective.
I "repaired" such a broken 1050 by equipping it with a speedy 1050
(which comes with a standard 6502).

so long,

Howdy folks

I've added a link to Nicolas Coplin's site to my site.

Nicolas is working on two utilities:

One converts *.AVI movies to Commodore 64 picture format (this one runs on a PC).
The other (no code yet) will run the converted code on the C64.

Now come on folks, you're not gonna tell me this can not be done on our trusted Atari 8 bit computers too.

BTW you need either a REU (Ram Extension Unit. This is a memory expansion, but I guess it's external.) or a Harddisk (plus his own fast hardware or software, I'm not sure).

CU Mathy van Nisselroy

PS here's the link so you don't have to search all over my site.

Hello

First of all, thanks for your replies.
The main question should have been: How many WATT do I need in a 220/110V transformer (adapter?) for using it with my Atari stuff?

All my Atari PSUs use 110V as input, but I can get only 220V directly from the mains.

I've been talking with a friend and he told me that 100 WATT would be enough for my purpose. I have some options, going from 50 to 2000 WATT, but I was not sure which one would be suitable for me.

Anyone disagrees?

## 165. ABBUC Programming Contest

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-08 13:03:27 UTC
From: Mathy van Nisselroy <mathy.van_nisselroy@post.rwth-aachen.de>
Message-ID: <avh7j0$t6d$1@nets3.rz.RWTH-Aachen.DE>
Source record: 24228

The ABBUC (Atari Bit Byter User Club) Software Programming Contest.
(Official version)

At the latest yearly meeting of the ABBUC, the members of the ABBUC have decided that a software programming contest should be held. The purpose of this contest is to encourage people to write high quality software for our beloved 8 bit Atari computer. It has also been decided that a small amount of money shall be used as price money.

The resource manager software for the ABBUC - Sorin Pascu - has 1000 Euro (approximately 1000 US Dollar) at his disposal that will be divided in the following manner:

1st place: 500 Euro
2nd place: 200 Euro
3th place: 100 Euro
4th-7th place: 50 Euro each

The following types of software will be rated:

- Utilities
- tools
- games
- etc.

Games seem to be the most popular. Here are some qualities a game should have, if it is to be considered for first price.

A game should have the following properties:

Good graphics
Good sound
Good music
High fun factor/great playability for an extended period of time.

Tools and utilities should run under all DOS versions and be usable by all without special requirements.

During the set up, multiple languages should be used to enable everybody to set up your software, if needed.

The file itself should use the english language. We believe that everybody does speak atleast a little bit of english. If your English isn't very good, you are free to ask somebody to translate text for you. The game, utility or tool should run on a 64kB Atari 8 bit computer. Use of a RAMdisk should not be a requirement. If you software needs more then 64kB of memory, your software should test if a RAMdisk is present. If not, data should be loaded from disk. If there is a RAMdisk, your software needs to

test which banks are present (to prevent software from not running on certain RAMdisk types.(*) ) and load it's data from there.

All software should run on a non-upgraded 1050 disk drive. You are allowed to use more then one disk side, but the 1050 has to be able to read it.

A home page is available at http://www.strotmann.de/twiki/bin/edit/APG/AbbucProgrammingContestEng/. The rules for this programming contest should however be available from the ABBUC home page, since it is the main access point.

Deadline will be the 15th of September 2003. This will give the ABBUC enough time to have a jury evaluate all the entries and pick a winner.

All jury decisions are final. The ABBUC and the jury have the right to exclude persons and/or entries from the contest.

All entries will become property of the ABBUC.

Have fun programming.

All entries should be sent to:

software@abbuc(no..SPAM).de

or:

ABBUCev. Programming Contest

## 167. Newbie question about startup menu....

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-08 16:31:06 UTC
From: Vader <replyto@newsgroup.please>
Message-ID: <3E1C5249.5080305@newsgroup.please>
Source record: 24230

Hi all,

I just discovered the world of emulation, and have since been going like a wildfire reliving my youth (a BIG thanks to Holmes!). I have been shaking the cobwebs off of my memories, but can't seem to get one little detail, and I was hoping that (after laughing) someone would be able to help me. I remember that there was a program (or some way of formatting a new disk and transferring system files) that I had on each disk such that, upon entry of "dos" at the command prompt, a menu would be displayed (delimited by letters) for each of the basic functions (ie. move, copy, delete, run, directory, etc). Thanks!

Pretty much wide open possibilities. I would check the diode bridge in the rear left; that's where mine was blown. Something like CR16-17-18-19; measure resistance in each direction with a VOM. Low ohms both ways is usually the bad one; it was fairly simple to desolder and replace.

You're talking about a 'DOS' disk. You boot it,
if you hold OPTION, the menu comes up (on menu
DOSes, like DOS 2.5, 2.0S, MyDOS 4.53).
If you don't hold OPTION, on a XL/XE (we're talking
emulators here), you get the BASIC READY prompt.
From READY, you type DOS to enter the menu.
In addition to Holmes, which is now gone, there is
the spudster CTH archive, which is also quite extensive.
ftp://ftp.spudster.org
You can find DOS disk images there. They may be
.DCM files, in which case you probably need 'IMAGIC.EXE' from APE author, to
make a .DCM into
a .ATR for use with emulator.
Many .EXE or .COM or .OBJ game files won't run from
a DOS disk, they have to be loaded from a MENU boot
disk. And a lot of games are disk images.
But I ramble.

That certainly sounds like DUP.SYS which was the standard utilities portion
of Atari DOS 2.0S. Option 'H' was Write Dos files which put both the file
management system (DOS.SYS) and the utilities onto any diskette.

I bet I could whip something up in Linux using some free tools that'll
extract the frames of an MPEG into a directory, and then use some other
free tools to scale them down and resample them to something suitable for
the Atari.

The resolution of the video frames looks to be about 80 x 50
(at least in the screenshot of that MSDOS app.)

Since the Atari's more colorful modes are half the horiz. res. of the C=64
(e.g., 160x~200 vs. 320x~200), something similar would be about
40 x 50 pixels on the Atari.

That's about 100 bytes per frame. At something like 20 frames per second,
that's just under 2kB/s. So on my 256K Atari, I could play a video of
clip of about a minute and a half or more.

I think it can be done. I'd be happy to work on the MPG -> Atari tool. :^)

Using a 40 x 50 pixels of playfield, plus all 4 players & all 4 missiles
(which would be 40 pixels in width, as well), interlacing it similarly
to how I did in Gem Drop, I can easily get the following colors
without using any DLI tricks:

Black
Dark Red
Red
Dark Green
Yellow
Green
Dark Blue
Purple
Cyan
Blue
Grey
Light Red
Light Green
Light Blue
White

The playfield colors would be black, red, green and blue,
and the entire collection of PMs would be white.

...as an example.

As for converting an MPEG to single frames, apparently MPLAYER for
Linux can do this. I have it at home, so I'll try it out tonight!

Hi,
I was finally able to find several references on Google groups, but most of them dealt with the 1050 mod. Several references to a zmag issue, I will try to find my zmag files on the Pooldisk II. The file by Spark on Ron's site is a very good article about doing this mod on the 1050. Thanks for the help, I will also reread the Happy manual there may be something there that I have over looked.

Thinking about it some more, if I (or someone) could come up with a REALLY
clever way to determine the best palette of 15 colors (ones that can be
created by mixing the other 5 colors), each frame of the image could have
its own palette (adding only 5 extra bytes to the frame), which would allow
for some VERY nice interpretations of things like fades in and out,
and broad shots of single colors (like a picture of an ocean or field).

The 15 RGB-based colors I picked really look CGA. :^)
(Or C=64-ish, I suppose, too ;^) )

How much ram can the Atari 800 be upgaded to? I read about a third party 128k cartridge in Creative Computing, but according to the article, it had to have a 16k catridge on each side of it. Is this true, or can I install 3 of them for 384k? Is there a multitasking os for Atari?

Who sells Atari stuff?

```
Uhm, Kuba. I'm trying to follow what you're doing.
I have no idea what banking SpX does, but don't
think that is your problem.
You mention 2e0-2e2, that should be a 2e0-2e1
that your program.com has at the end of the code,
the last six bytes would be e0 02 e1 02 00 20 for
a program running at $2000.
You have to have your d301 ef or eb for the computer
to see the data you put in $4000-$7FFF.
The OS will run at the address specified, like I showed,
when 2e0 and 2e1 are the load address of your file.
I'm not rambling now, I can't figure exactly.

The three memory slots in the 800 each correspond to a 16k block of
address space. On the Atari 8-bits, most memory expansion beyond
64k is done by bank-switching the second 16k. Even if you could find two
or three of those 128k cartridges, I don't think the computer would work
with more than one.

Uhm, sorry. It is my fault in description. My RUN block is two bytes only
ofcourse......
At polish Atari group I have note that is an error in Sparta. It has I/O
buffers in XMS (in banked mode only ofcourse) and badly switch $d301
register when it reads/writes data to disk. I think solution is own loader
or loading each block for example at $8000 and copying data to $4000.

Thanks for picking up on the idea. I really love it. But is 40x50 all we
can have? Can't we go higher? (heck 16MB should give us plenty of space)

CU Mathy van Nisselroy

PS if you need somebody to beta test anything on the Atari (or not very fast
windows PC)

PPS have I told you I have a USB webcam........

> with more than one.

Only one of the cartridges can be replaced with a bigger one. (well, maybe you can replace all three of them, but two of them will only use 16kB). The one you can replace is controlled by the address $CFFF. All 8 bits of it I guess. meaning 2 to the 8th power or 256 banks of 16kB for a total of 4MB maximum. But you'ld have to develope it yourself, sionce the max I've seen advertised way back when was 1MB. I'm not sure if that was Magna Systems or Canoe.

> > I saw a gal/pal programmable replacement for Freddy somewhere on the
web.

What you saw was a replacement for the CO25953 or gate array or EMMU.
Freddy is something totally different.

It's on my stuff page. Tested by Christopher Lang (who also 'reverse
engineered' the code for the GAL) and Guus Assmann. U35 is an LS95B as I
had guessed, I told Chris, he tried it, it works.
http://www-users.rwth-aachen.de/mathy.van_nisselroy/stuff.htm#co25953

> Just a few GAL equations (except for that goddamn MHALT line - Mathy,

>
> My conclusion is that it may work on XLs, but maybe HALT/MHALT timings
> would be the problem.

Ofcourse it will work. MHALT is just Modified Halt, which is a shifted HALT
signal. Check out my site to read more about it.

BTW I intend to prove that it can be done as soon as I kick the last bugs
out of my upgrade. Most of them have disappeared since I created a new Phi2
signal.

## 187. Looking for RAM Expansion Docs

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-09 11:20:20 UTC
From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <avjltk$77j$1@mamenchi.zrz.TU-Berlin.DE>
Source record: 24250

Hi,

could someone please give me a pointer towards technical descriptions of
the various RAM expansions that existed for the Atari 8 bits? I'm not
interested in really buying any hardware, but a functional description would
be great as I want to support them in my emulator (the atari++).

So long,
Thomas

## 188. Ethernet card and MP3 for C64 (me want for Atari)

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-09 11:27:58 UTC
From: Mathy van Nisselroy <mathy.van_nisselroy@post.rwth-aachen.de>
Message-ID: <avjmbv$ktf$1@nets3.rz.RWTH-Aachen.DE>
Source record: 24251

Howdy folks

Check out this site:
http://www.volny.cz/dundera/devices.html
They have among other things, an ethernet card (looks not too complicated)
and an MP3 player card for the C64. And Vanessa Dannenberg is working on an
MP3 cartridge too (the MP3 decoding is done by a chip on the cart. The
computer is only used to stream the data to the cart).

This should be possible for the Atari too.

## 189. Atari 1050 FDD question...

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-09 11:29:51 UTC
From: misterbumpy@wmconnect.com
Message-ID: <20030109062951.18825.00000352@mb-mt.wmconnect.com>
Source record: 24178

Years ago I had several 8-bit Atari systems around the apartment and loved them all. Sadly, I had to move and needed space, so I gave away all of my old Ataris, Macs, software, etc. :^(

I had four 1050 drives in my possession and although this might sound silly, I must ask... what exactly is a "happy drive" and how can you tell if the drive is happy-enhanced or not?

I realize it's too late now but was thinking of grabbing another 800XL next chance I got and needed to know for curiousity purposes.

Thanks!

> be great as I want to support them in my emulator (the atari++).

Try my upgrade. A schematic and a far from finished description is
available at:
http://www.holyoak.com/atari/8bitcomp.html
An article can be found at
http://www.myatari.net/issues/may2001/memory.htm

I recently added a 74LS74 to create a new Phi2 signal (Mexican CPU's are
notorious for their bad Phi2 signals), but that doesn't concern you if you
only want to support memory upgrades in your emulator.

Most important info:
If both PB4 and PB5 are high, the computer works like it always does. (no
RAMdisk access)
If either PB4 or PB5 or both go low, the status of BASIC, SELFTEST, OS
RAM/ROM and Missile Command can no longer be changed untill both are high
again.
All bits of $D301 are used, 4 and 5 only for CPU and ANTIC access (separate
ANTIC and CPU access is still possible) all other bits (0, 1, 2, 3, 6, 7)
are used to control which bank of memory is being accessed.

I plan to try and find a 4MB or 16 MB 30 pin SIMM in the (near?) future and
add hardware to support this. The extra bits I'll need for this will be at
$D305. I'm probably gonna use bits 2, 3, 6 and 7 of this address (to
prevent problems with software that doesn't access $D301 but an other
address that is a multiple of 4 higher.)

>-bill!

Are you sure you don't want to use interlacing? Oh, wait, I just noticed you said you're using it...

Frankly, my suggestion would be to trick the eye... use something a la ColrView but instead of decoding R, G and B images out of the original, let's say you take R from a given field, then G from the next, then B from the next, etc. Or... have a frame start from the top line being R, next line G, next B, then the next frame changes to G, B, R, then the next to B, R, G, then back to R, G, B. Given that mostly there are no big differences between a line an the next, it could work. Or instead of alternating R, G, B use alternating chroma, luma lines (isn't there some graphics program that does right that for 256 colors?), next frame switches to luma, chroma, then the next again is chroma, luma, etc. If you use this last approach, the luma lines only have to take the grey level (calculated from the R, G, B levels) and the chroma lines only the closest color from the Atari's 15 (16 if you count black)...

Those ~3-5MB Star Trek MPEG promos (20-30 secs each) would be ideal for testing purposes...

Source record: 24254

I'm still not understanding very well.
XMS? Extended memory I guess.
If you seem to be saying SpX uses banked memory
at $4000-$7FFF for an I/O buffer, have no idea.
SpX will work on a 64k machine, or even a 48k machine,
so it can't be using extended memory for basic functions
like SIO and CIOV.
Well, nobody else is answering, so good luck and maybe
you'll get your answers.

The highest I ever heard about that was described and also built to validate functionality was the 1088K Atari 800, and no, you could not add more than one expanded memory card and have access to the cumulative total memory. There is control circuitry on the expanded board designed to operate in only a specific slot.

Yes. sort of... Tom Hunt wrote a couple of MTOS utilities; check his Closer To Home site.

## 195. Holme's CDs for sale, here is the address

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-09 21:50:04 UTC
From: Steve S <j70141@hotmail.com>
Message-ID: <3e1dec0d$1_2@news.teranews.com>
Source record: 24259

I just received Holme's CDs today... there was three of them.

It is quite a collection, there appears to be quite a bit of stuff on them that I myself never saw on the website. It is certainly a fine collection.

I think I can get these out to anyone that wants one for about $15 without losing my shirt. I promise I am not making any money off of this, anyone that thinks I am getting rich off of this is an idiot. This covers the cost of the CDs, shipping & handling, packaging, the making of the CDs, the cost to put it on ebay (yes, I did that too... some people may be more comfortable doing it that way and it may make payment easier for some [ebay verification for me was $5, then there is what I have to pay to have it posted), and whatever else pops up. (I just lost my job today folks, so I think I will have more time than usual to make the CDs) I only hope I don't end up losing money because of this, I will let you know if what I have to pay ends up being different than what I am asking, and make adjustments accordingly.

To get the CDs, send $15 to:

Steve S.
PO Box 70141
Las Vegas, NV 89170

or go to the ebay auction and make a payment there:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2087785348

The web site says that you will pay for shipping, but that is not so. If you are located in the United States, I will worry about shipping. I only left that option open in case I get someone from out of the country and the costs for shipping add up to more.

Personal checks will have to wait until clearance.

I've read that the C-One should be "upgradable" with interface cards to be
an ATARI 2600 Compatible or ZX81 Compatible, maybe the ATARI Community can
join this project to make a ATARI 8Bit Compatible.

This was already shown at the Amiga & Retro Fair a few days ago

Steve,
I'd appreciate you not using the name 'Holmes' on your ebay auctions.
If you can change it, that'll be great. It's not really needed to sell the
CD's. I dont mind you using Holmes to describe them here in the newsgroups
or on your own website, but Ebay are very picking about CDr's being sold on
ebay, and I dont really want to be associated with the practice.

Thanks. Glad the CD's turned up finally. Sorry to hear about your job
hope something comes up.

My sincerest apologies, it did not occur to me (I've been a bit stressed today) to keep your name out. I went to change it immediately, however I think ebay takes out the link to make the change once somebody makes a bid. It will allow me to ADD to the description, but not much more. I will not make the mistake again.

About my job, I appreciate your concern.

> I'm still not understanding very well.
> XMS? Extended memory I guess.
Yes.

> If you seem to be saying SpX uses banked memory
> at $4000-$7FFF for an I/O buffer, have no idea.
> SpX will work on a 64k machine, or even a 48k machine,
> so it can't be using extended memory for basic functions
> like SIO and CIOV.
Now I don't understand you.... ;)
I mean that it works at nonextended Atari (I know, I know - Memlo is to
high, but it is only example).
But if you put 'use banked' in config.sys in one of the memory banks Sparta
has its buffers and some procedures. In load process it badly switching this
bank.
Example (Sparta bank is $8f for example):
1. You set bank to $ef.
2. Sparta switch $d301 to $8f starts to load your block to its buffer (in
$8f).
3. Now should be:
lda #$8f
sta $d301
lda buffer+n
ldx #$ef
stx $d301
sta $4000+n ;in your bank
but it dont switch back to $ef bank.
OR
it not switch to $8f bank to take proper byte from buffer.

> Well, nobody else is answering, so good luck and maybe
> you'll get your answers.
Thanks!

Source record: 24266

OK. SpX does use memory at $4000-$7FFF, and
you're saying it messes up your efforts to also use
banked memory. I have SpX, but rarely use it, its'
high speed disk I/O messes up my disks.
Your example, 8f in d301, is banking RAM under
the OS (C000-FFFF). I've never understood this.
A 8f in d301 banks c000-ffff to 4000-7fff. There is
a way to use the C000 memory under the OS on
XL/XE machines. I don't remember the controling
mem location, all Sparta type DOS use this memory.

If SpX is messing you up with your efforts to use
extended memory, maybe use a different Sparta,
like 3.2G?
I don't think if I shut up, somebody who understands
this will be more likely to respond.
Regards,
Russg

## 206. Atari 8-bit eBay auctions - about to close

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-10 18:54:38 UTC
From: Dean Garraghty <dgs@clara.net>

Source record: 24267

Hello All,

I have some Atari 8-bit eBay auctions which are to close tomorrow for: set
of European (multi-language) Atari 1050 manuals (includes the DOS 3 manual),
Hi-Res magazine Vol 1 Issue 4, manual for the SCRAM nuclear power plant
game, Atari CX77 touch tablet (boxed), Atari Macro Assembler disk. They
expire tomorrow, so if you want to bid, you'll need to be fast! The link is
below (this
will split on to two lines, so please copy both lines into your browser):

> I see a lot of people connecting that's GOOD!
>
> I like to ask the people that download please upload also please... this
> will make it even better for others...

I just wanted to say a little something about the disk images I upload (Dennis disks)...

They are mostly typed in programs from COMPUTE!, Antic, and A.N.A.L.O.G. The typed in games from A.N.A.L.O.G. start from Dec. 89 (I think, it's the issue with Dungeonlords) and go up until the magazine was canceled :( I didn't have an Action! cartridge at the time so if the type in was for Action! I didn't have it.

Also on those disks are 3 games written by me a while ago in AtariBASIC. Mow Down was accepted to be published in A.N.A.L.O.G but the magazine closed shop before it appeared. Nuclear Reactor appeared in Antic right before the last issue. It's basically Mow Down with small changes. The other one is Bust Out which was my bad attempt at doing Arkanoid in AtariBASIC.

Anyway, I didn't add any documentation when I uploaded the disks so I thought I'd mention it.

I'll see if I can go through my other disks later. I also have typed in programs from A.N.A.L.O.G that weren't game programs. One that I know of is Basic to Binary which converts your AtariBASIC programs to binary.

Take care,
Dennis

> Help me: how do this? TIA!

I'm surprised no users of the 'worlds most powerful DOS
for Atari 8 bit computers' has not jumped with some
definative answers yet. Perhaps it really isn't or
perhaps those who quote the above often haven't looked
under the hood enough to comment.

I have SDX but don't like it nor use it. But in my
snooping around, I found that the boot up extended ram
test to be always destructive to any pre-existing data
in the banks - which may be one part of your problem.

The other part may be that even though you can
configure SDX to _not_ use extended ram, it does anyway
for at least one bank. IIRC that would be bank EF and
the code which resides there can not be disturbed or
SDX will crash. IIRC the whole bank is not involed
just the first few 256 byte blocks - maybe four or five

in total. The rest of the extended memory is yours to mess with as you desire IF you have SDX set up to not use extended memory or a ramdisk of anykind.

I used Bug/65 to do my snooping around and directly changed the banks to preload data and then do cold/warm start functions and then look again to see what was going on inside the extended memory banks. But that was many years ago and my memory has rightfully and perhaps correctly been challenged before. IIRC, I had a descrepancy in the total free sectors of my one meg Newell ramdisk and I was attempting to find out where the missing sectors went. If you can figure out a way to set up your application with the above in mind, it should then work - but you should verify the above if at all possible before making the changes to your code. I'd hate to see you do all that work and then have me found to be full of faulty memories once again! If Russ is ramblin' Russ, then I must slightly senile .... :)

## 211. New 'budget' Atari 8-bit CD-ROM from DGS

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-10 23:28:30 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1042241349.62311.0@iris.uk.clara.net>
Source record: 24272

Hello All,

I am hoping to release a new 'budget' PC CD-ROM containing just the Power Per Post Atari 8-bit products. This will be in similar style to the 2 other CDs I've released, but it will only contain the PPP products. As usual, you will get the full commercial (and fully licensed) versions of the software in both DCM and ATR format, along with full manuals in PDF format. The CD will contain:

* Quick Programming language V2.2 (latest version) and V2.1 (for compatibility with older QUICK sources)
* Quick Support Disks 1 and 2
* SAM (Screen Aided Management) V1.25i (80-col desktop system, similar to GEM - no additional hardware needed)
* SAM Budget (spreadsheet)
* SAM Designer (DTP/designer package with circuit diagram creation facilities - very powerful)
* SAM Utility Extensions (conversion between SAM and non-SAM formats)
* Rubber Ball (game)
* Glaggs It! (game)
* Bombi (game)
* Mine Sweeper (game)
* QuickEd (Character set editor for mouse, joystick and touch tablet)

As usual, because of license restrictions, this CD-ROM will not be available to anyone in a German-speaking country.

The price of this new CD will be US$9.99 which will include airmail shipping to any country.

The 2 other CDs containing a wider range of software will still be available.

At this stage I need people to e-mail me with an interest in this new CD. I am likely to go ahead and do the work for it and release it, but I still need to know how many are likely to be sold. Please e-mail me (don't post back to the group because I only read the newsgroup every couple of days) if you would be interested in one of these new CD-ROMs. Payments will be available by credit card by PayPal as usual. E-mail: dgs@clara.net

Hi,
I haven't had any luck locating this information either. So I will probably disassemble the drive and check traces to find any connection points for a switch. I might also set a switch on the front of the drive to change disk ID instead of turning this heavy tank around each time I want to set it as a secondary drive. I really hate to use this a my primary drive but sometimes my 1050 will not boot a disk when this one will boot nearly any single density disk thrown at it, no matter how old and dirty the diskette. 15 years of damp and humid condition where these old disk were stored has really done a disservice to the magnetic media enclose in the sleeve. Constant cleaning of the drive head helps a lot. The website for the Ape software under diskette information is very informative information about the care and cleaning of older diskettes.

Thanks for the efforts
RoyE

I have an 800 with 512K in it.

I have a 130XE with 1 Meg. Newell upgrades for the 130XE and 800XL went to 4 Meg. I've never heard of a 6502 "stock" Atari beyond 4 Meg. There was an Atari compatible that supposedly could go to 16 Meg with its 65816. I've seen/touched the compatible, but don't know how much memory it actually had. Larry

> I would like to remember how to install a switch on my new 810 disk drive to write protect or to enable writing to the back side of an unnotched floppy. <

Try-
ANALOG JUL 86 p9 Schelb, Steve
"The 810 Flip Switch"
Hardware mod to the 810 Atari drive to
permit it to write to the back side of
a double sided diskette without having
to punch a write hole in it. (DISK)

IIRC, this guy used a square switch instead of round. Round would have been a lot easier to install since you could drill the hole.
Larry

Not 100% certain I understand the question... At the DOS menu, it is just a matter of entering the letter representing your choice (followed by <Return> for Atari version 2.0S) and answering the prompts. Default for files assumes that the "D1:" device precedes the name and requires "D2:FILENAME.EXT" etc. for others; standard "*" and "?" wildcards for groups of files; "C"opy is for two devices (E:, P:, D2: etc.) or file on same disk with different name; "O"Duplicate puts files on another disk using the same names with a single drive. There is a DOS manual on the Atari Tips & Tricks site.

The info does exist; I think I have seen it at least twice in the last 20 years. It was very similar to the 1050 mod with the patches made at a 4-pin connector over on the left side. I simply do not know what goes to where.

Putting this on ebay is not wise. You should not be auctioning off this stuff.

## 219. Re: Another newbie question.....

Hi,
In order to print the directory of the disk contents to the printer the dos
command looks like the following. Press 'C' to envoke the copy command:
at the prompt then type in the following information for menu responce:
This will get a listing of program files printed to hard copy on printer
D1:*.*,P:
This will get a listing of program files printed to the screen
D1:*.*,E:
or with some DOS's not sure about all of them
D1:*.*,S:
SPARTA DOS and compatible Dos's
DIR *.* P:
DIR *.* E:
SPARTDOS also has a TREE command that will read the subdirectory files. But
I am not sure how to redirect this command to catalogue the disk contents to
printer.

Good Luck
RoyE

Hi,
The following information about fixing a Write protection switch and Drive ID switch might be more basic that what you have in mind.

1050 WRITE PROTECT SWITCH
==========
by Dan Knauf

(This article originally appeared in the December 1990 issue of the Puget Sound Atari News magazine.)

First the disclaimer. Neither I nor S*P*A*C*E assumes any liability for any damage caused by performing this upgrade. I have been using a drive with this modification in it for about 3 weeks with no problems. However, if you decide to do this project you do so at your own risk. Now that we have that out of the way...

I decided to install a write protect switch in my only un-Happy 1050. I had a couple of public domain text files describing how to install such a switch. One of them required using a circuit board and an IC chip along with numerous other parts. The other one required a DPDT switch and an LED. While this one required cutting or splicing into four wires on the drive, it was more to my 'lazy-man' liking.

I proceded to install this version - getting fancy and making a 6-connector plug so I could still remove the mechanism from the drive if I needed to later. When I was all done, I fired up the drive to test it out. Every thing worked just fine. I had three write protection modes - ALWAYS write, NEVER write, and NORMAL (use-the-disk-notch) mode. However, the LED only lit up when the switch was in the ALWAYS mode. I am used to my Happy drives that let me know whether I can write to whatever disk is in the drive by having this LED on if I can write and off if I can't. I wanted this drive to work the same way.

I decided to LOOK at the directions I had FOLLOWED and see if there was a way to make the LED work the way I wanted it to. The first thing I noticed was that I had had to splice into one wire and cut one wire more than was necessary. This added up to one whole side of the DPDT switch. Figuring out how to make the LED do what I wanted took some further digging though. I hauled out my trusty 1050 field service manual and discovered that pin 36 of the floppy disk controller was where the write protect signal ended up. Hmmm..... I wonder..... I think I'll try it.

Now that I have taken up some space to make the editor happy, here's how I installed my write protect switch and an LED that works right.

Parts: 1 - SPDT center-off switch.
1 - 1k resistor (brown, black, red).
1 - LED (I used a yellow one to match my Happy's)
A little wire.

(Sorry, no Radio Shack stock numbers - I had all of these parts just laying around my house!)

WARNING: There is nothing dangerous or risky about the write protect switch if it is installed according to these directions. It is, however, possible that installing the LED as directed here could cause the disk drive be unable to write to a disk. The LED uses the power from the write protect pin of the floppy disk controller. The power at this pin is what tells the controller that it is ok to write to the disk. If your 1050 has a weak power supply it is possible that the LED will draw enough juice from the pin to make the controller think it isn't supposed to write to the disk. I don't think this is too likely, but it IS possible. If this happens, you could try using a resistor with a larger resistance value in place of the 1k resistor. (Which also will dim the LED some.) If that fails you will have to do without the LED. For this reason, you may want to install the write protect switch then hook up the LED ciruit and test things out BEFORE you drill the hole for the LED.

Switch installation:
---
Open the drive exposing all those fancy electronics. All referrences to places on the drive assume that the front of the drive is facing you and it is right side up.

Now you have to decide where to put the switch and LED. I mounted mine on the front of the drive just to the left of the drive mechanism. I drilled the hole for the switch so that the center of the hole was about even with the bottom of the mechanism slot. I mounted the LED just above that. This matches the way it is done for my Happy drives.

Once the holes are drilled, find the row of plugs on the back left side of the mother board. Cut the wire going into these plugs which closest to the front of the drive. This wire goes from pin 1 of J11 to the light sensor half of the write protect circuit. Solder a piece of wire about 11-12 inches long to each side of the cut you just made. Hook the wire from the plug (J11) side of the cut to the middle pin of your SPDT switch. Hook the other wire to the top pole of the switch.

Next you need to remove a little insulation from the wire immediately behind the one you cut. This is the wire going to J11 pin 2. For you techies, this is one of the leads going to the light emitting side of the write protect circuit. You must solder a 12 inch piece of wire to the place you exposed. Alternatively, you could solder this wire to the bottom of the motherboard where pin 2 is attached. The other end of this wire goes to the bottom pole of your switch.

If you haven't mounted the switch yet, you can do so now. The wiring to it is done.

LED Installation:
---
Cut two pieces of wire about 8 inches long. Solder one end of one of these wires to pin 36 of the 40 pin chip just towards the front of the drive from J11. Pin 36 is the 5th pin from the front on the left side of the chip. Also, this chip is the left-most 40 pin chip and should be marked as WD279x. (The x in the number could be either a 7 or a 3 depending on where the drive was made and who has hacked on it.) Solder the other end of this wire to your 1k resistor then solder the other end of the resistor to the LONG lead of the LED.

The wide foil strip running along the top left side of the motherboard is ground. Take a knife and scrape a spot big enough to solder a wire to down to the foil. Solder the remaining 8 inch wire to the spot you just scraped. Solder the other end of this wire to the SHORT lead of the LED.

All that is left is to mount the LED in the hole. I used a hot-melt glue gun for this. Hastily reassemble the drive and you're done!

You now have a write protect switch with three modes. In the up position you can ALWAYS write to any disk whether it is notched or not. In the middle position you can NEVER write to a disk even if it is notched. With the switch in the bottom position the drive acts NORMAL. Ie., you can write to a notched disk that is not write-protected and you cannot write to a write-protected or un-notched disk.

The LED will always be on if you can write to the disk that is in the drive. It will always be off if you cannot write to the disk in the drive. Note that in the NORMAL mode the LED will also be on if no disk is in the drive.

Also this information from this site is the same stuff:
http://www.atariland.com/members/oldatarian/sparky.htm

There is lots of stuff about the 1050 on the internet. Just get to a search engine and type in ATARI 1050 MODS. There is the USDoubler by ICD here:
http://www.geocities.com/atarimods/usd-ram.html

1050 service manual for sale here:
http://www.best-electronics-ca.com/8-bit_.htm

Information about the speedy 1050 can be found here:
http://www-user.tu-chemnitz.de/~sgl/atari/books/speedyhb_eng.html

Happy Mods and cleaning and servicing tips also to be found by searching the web.

Good Luck
RoyE

Hi Kenneth,
I don't consider that this is an auction. It is more like a gifted method
of insuring that those people that would like to maintain this information
will be able to recieve it at a fixed, nominal, non profit cost. Besides
all copies are going for a fixed cost of 15.00 dollars. I doubt very much
if any one of the offered 100 sets will be bid any higher than the asked for
above mentioned price.

Regards,
RoyE

Perhaps this mode is just too slow? However, that this mode can be quite fast, can be seen on Numen when the nice flower (rose or whatever) is in front and on the back, the blue stylish circle is "wobbling" (don't know the name of this effect).

I think he's meaning re the technical aspect of selling pirate goods,
they tend to have a suspend the account policy for that which won't help
anyone.

I'd have preferred them to have gone up on a server so there's a lesser
chance that access will be denied to them, they are great CD's with a
lot of hard work by Aaron who collected and sorted through CD's of stuff
sent by me and many others.

## 226. mouse problems & how to open my ST

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-11 15:51:24 UTC
From: Richard van Vugt <ricardo@euronet.nl>
Message-ID: <3E203D7C.9010909@euronet.nl>
Source record: 24284

Is there anyone who could help me with the following:

The mouse of my Atari 1040 ST does not work properly anymore. The mousepointer does not work, and doubleclicking only works after several clicks. I tried an other mouse but this one has the same problem. So, the problem must lie within the ST. I heard of loose mouse contacts in a newsgroup, so I want to open my ST and try to solve (solder) the problem. I opened the ST, and now I do not know what to do with the 28 tiny screws at the back of the keyboard print panel where at the back of it are the mouse contacts, I presume. Can I loosen them? Is this the right way?

Thanks for your help!

Richard van Vugt,

Source record: 24286

Hi,

I got a lot of questions about uploading:

Q) What must I upload?

A) It's just what you like to share. When possible document the files or images with a little text file.

Q) What about illegal software?

A) My point in this is, whenever there is software that's not being produced, sold anywhere for several years just upload it, or send me a list of programs so
I can check if there is some software that is still being sold, supported or produced.

Q) How much must I upload?

A) You don't need to upload, but just upload what you have and not see on the ftp server. This way the server is updated and more people can download new
uploaded files.

Q) Can I order CD's?

A) No at this time, the ftp server is completly free and I will keep it that way as long as I can....

Q) Can I send CD's I have to much to upload..

A) Yes you can, just contact me at txg01@xs4all.nl

I hope I have answered the questions.

TXG/MNX

## 229. Re: Holme's CDs for sale, here is the address

Newsgroup: comp.sys.atari.8bit

Source record: 24288

I would not have accepted anything over $15 anyways. $15 seems to be enough to get the CDs out. I would also like to point out that I will "NOT" be putting these CDs out on ebay anymore. This is only a one time thing to get the bulk out as quickly as possible and as easily as possible. Once all (11, so far) people have their CDs, you can get it from them or we can go through the snail mail route.

Holme's has placed a little note on the CDs in the "readme.txt" and I have made sure that it is on the CDs. It basically states to please distribute the CDs as you wish, just don't profit from it. I have listed my costs in making the CDs and "_N-O-N-E_" of it is associated with making money off of the games. It is primarily in shipping, handling, processing, materials to ship, purchase and creation of the CDs, price to put it on ebay [$5 for verification, plus posting costs], and I even included the costs of what I had to spend to be assured I would GET the CDs (which was approximately $1 per post card [international postage, and post card price itself]), and I sent a lot of those post cards too. I am not sure if paypal charges to use their services, but I found out I do have an account with them, I have just never used it. So, if I do make anything off of this at all, it will end up being so little that I likely wouldn't be able to purchase a McDonald's happy meal with it.

As a side note, I do know a little about the copyright laws and there are a few things about it. As Holme's did, I will gladly remove anything from the CDs if the author of the game asks me to. Also, if a company knowingly ignores a copyright for a period of time they lose their rights for a lawsuit (there is a lot of legal complication with it that I do not wish to go into). The contents of the CDs have been available on his website for ages with little or no complaint, open to the public. Lawsuits and Charges on breach of copyright focus on loss of income and the money made off of the material. Since they have not been sold for a long time, there is no loss of income. Since I am not making profit from it, I am not making money off of the material. In essence, it isn't worth pursuing when it is involving 20 year old software that would not sell even if it was on the market.

The CDs are advertised as being the contents of a web site and that is exactly what they are. It is the Holme's Web site and all it's contents.

Again, if there are any complaints, I will handle them accordingly, including not giving the CDs out anymore.

For those that have emailed me asking to send payment right away to get the CDs right away, I am still in the process of making the CDs. I do not have a complete set to send out just yet. I have been making them a group at a time and I am not even done making the group for CD #1 yet (right now, I will make 11 of those then move on to CD #2), so it would not do any good to

send payment right now anyways.

It takes me 5 minutes to set up my SLLOOOW computer to start burning, then it takes 10 minutes to do whatever it takes to prepare the files before burning, then 45 minutes to do the actual burning ( 2x write speed, it is an old one) which is about 60 minutes per CD. I have to make four of them instead of three because my burner will only make 650MB CDs and I have to move some of the stuff to a fourth CD since what I have is 700MB CDs. The two folders ATR Games and ATR Programs fit on the first CD however and will probably be the most used. With 11 sets so far, I would have to spend 44 hours to do this. (Anyone think I am doing a get rich quick thing?)

I think I have covered most of the questions so far, let me know if you have more.

Remember, I am only devoting my time into doing this ebay (and maybe paypal) thing once and that is it. After that, it is request by snail mail only and I will not be so devoted either, so it may take a while. Now is the time to get the CDs if you want them.

Sorry, Roy, but you are copying the files rather than the directory listings
to those devices...

You should use the "A" option and answer the prompt with which files you
want separated by a comma from where the listing will go such as:
D?:*.BAS,P: or
D1:*.*,D1:MYLIST.TXT

to
> write protect or to enable writing to the back side of an unnotched
floppy.

Depends on your 810. Some had mechanical micro switches, some had photo sensors. If your drive has a microswitch, you can just replace it with a toggle switch. One position would be always write protected, the other would be not write protected. I used a 3 position switch and have protect/not protect/normal. To do the 3 position switch mod with writeprotect indicator LED I would have to send you more info, as it is a bit more involved. First check to see which type of sensor you have.

Paul

## 234. An unhappy non-customer

Newsgroup: comp.sys.atari.8bit

Would someone be so kind as to help this poor gentleman out?

btw folks, I just reached my 'break even' point. I needed about 13 sales to break even. I neglected to add the cost of 'coasters' (failed records), but the 13 mark should be okay. I only have two coasters so far. I am almost done with the first CD and should begin on the second CD some time tomorrow. Which means I should have my first set in a couple of days.

Subject: Question for seller

> Hi there. I have a copy of these CDs that I received from Holmes. It was my understanding that he gave these out to friends, etc. and had no intention of selling them. If you read the .TXT on each of the CDs, he asks that the CDs are copied for friends and NOT sold. I'm sure if he found out about this, he would be extremely unhappy. Your auctions are pretty unethical and I hope you don't spend a lot of your time within the Atari 8-bit community as it gives the rest of us a bad name. Not all of us are grubbing for money - we actually enjoy the hobby.

Source record: 24295

I totally agree I would like to have one of these.

Who is willing to help?

TXG/MNX

The following upgrades have been made in the past by several persons. We could combine them...

-65816 processer done
-memory upgrade done (1Mb) but the 65816 can handle 16MB...
-IDE interface done
-RS232 interface done
-Printer interface done
-RTC clock done
-Midi interface done
-PC card bridge done

Even more, would be great to have one place where people can find all these upgrades. When combining them to 1 big upgrade will make a new Atari much easier..

## 237. Micro-SPL - the parent of Action! ??

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-12 15:04:58 UTC
From: NoOne@FakeEmail.invalid
Message-ID: <930164CCFPrivacyLabs@209.143.0.11>
Source record: 24296

For A8 historians, check out:

http://www.pipeline.com/~hbaker1/Micro-SPL.txt

I just found this page on the web. It describes a compiler called Micro-SPL that was published around 1980. Originally written for DEC and Data General computers, it appears that this Micro-SPL was the direct predecessor to our beloved Action! programming language. I do not know this for a fact, but notice the following items on that web page: One of the authors is a "Clinton Parker", and the syntax of the Micro-SPL program example. Very similar to Action!. Although I do not have the time to investigate this to see if this is truly "our" Clinton Parker that co-wrote Micro-SPL, perhaps an Atari Historian might find this of interest?

Best,
Tom

## 238. New eBay auctions - Mapping the Atari & loads more

Newsgroup: comp.sys.atari.8bit

Hello All,

I have just started new eBay auctions for a copy of 'Mapping The Atari (Rev Ed)', along with various other books and manuals, including a complete near-mint set of European 800XL manuals, and 5 issues of Atari Explorer (1989/90/92). I also have an Atari Light Gun for auction, and loads of other stuff. The link is below (this will split on to two lines, so please copy both lines into your browser):

Joe, I don't have a CD burner and I believe you're wrong in assuming that Steve is trying to make money here. His CD burner is slow, it takes about 4 hours to burn 4 CD's not counting failures. It also takes the materials the CD itself and electricity as well. I have no problem paying someone for their time and effort and postage and cost of materials for making me a copy of those CD's. As far as I'm concerned the more people that have them the better and the longer the Atari 8-bits will be remembered which should be the goalof every true Atarian.

And even if someone were trying to make a profit, I couldn't care less, no one is forcing anyone else to do anything they don't want to do, and I would gladly have paid more for these without any complaints.

The odds are rather high. I tried to track down C.P. a couple of years ago (to find out if he had retained the "rights" to ACTION! ), and his address in the '80's was shown as Rochester, NY.
Larry

## 242. transferring atr to tape

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-12 19:49:32 UTC
From: quizzers1@hotmail.com
Message-ID: <894cb5a7.0301121149.7dcef7f7@posting.google.com>
Source record: 24150

Hi all,

I have just bought an Atari 800 XL. It uses a tape cassette to load games. There seem to be hundreds of games available on the net, but I don't know how to transfer them to tape cassette for use on my machine.

Is there a program to convert .atr programs to WAV files so that I might record them to tape?

Thanks in advance,

Ange

Hmm I don't know about a program that converts .ATR to tape but there is
this .CAS format.
It allows you to use digitalized tape converted to .CAS in an emulator.
There are 2 programs.
WAV2CAS and CAS2WAV this last one convert a CAS file back to audio tape.

I have several .CAS files on my ftp server:

FTP: atari.xs4all.nl
Port: 21
User: atari8
Pass: atari4ever

Get the SIO2PC cable, it will hook up your PC to your Atari and make the
Atari think it is just one big disk drive. Then you can play the games
without using the cassette player.

IF however you insist on putting it on cassette. Load the program into the
atari (using the SIO2PC cable) then I think there is a command like CSAVE to
let you save it to the cassette.

Need an SIO2PC cable? Here you go:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=1247&item=2087131362

Or just do a search on ebay for "SIO2PC". That's how I got mine, and I love
it. They guy that made it did excellent work.

Body handling: HTML body converted to readable text

Hi Paul,
I got it open and there is a microswitch with wires connecting at the left rear of the drives pcb. Looks easy enough just for a remote switch to be attached at front of drive bypassing the micro switch, but I would like to have the information about the LED.
Thank You
RoyE

From: JP <myemail@home.com>
Message-ID: <50mU9.28503$No.3920@sccrnsc04>
Source record: 24156

I have to move soon, so I am selling off some of my rarer carts to help cushion the financial blow. I have several other ER carts that I might have to sell as well. It might kill me to sell 'Star Maze' and 'Mr. TNT' though.. :(

The auction starts tonight P.S.T. at 7:00PM. Here is the link

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3000548921

good luck.

Hi Mike,

I'm interested in some of the stuff, is it all 8bit? is there any ST stuff?
I'd be interested in a couple drives (either happy 810's or some 1050's) and
some software. Can you remember any of the software titles off hand?

CSAVE is only for Basic files and not appropriate for most games which would
be machine language... it would require some programming to convert boot
disks into boot cassettes and many might not be possible.

Probably the best way to do this on Atari (IMHO) would be to use the
MP3 decoder chip, and simply send the audio through the SIO port (the
same way cassette tapes could be played through the TV). I have no
idea what kind of control signals the MP3 decoder needs, but I'm sure
the SIO can cupply them. One problem with the SIO port may be the
limited speed (19200 baud serial). Surely the PBI would be fast
enough, but not all Atari's have them.

Also, why would you want to use the computer to send the MP3 chip the
data? 64KB of base memory or 180KB (assuming DD disk) isn't going to
amount to much audio. Why not go for smart media? 64MB of that is
DIRT cheap.

Just my 2 cents worth.

Stephen Anderson

## 258. Raster Music Tracker (RMT) - SID-like sound on your Atari.

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-13 09:05:33 UTC
From: keiva@atari.net
Message-ID: <9b7361ee.0301130105.31d0bc5@posting.google.com>
Source record: 24166

http://www.infos.cz/raster/atari/rmt/rmt.htm

Radek Sterba is in the process of creating some software for the Atari 8-bit/PC that allows a good number of new effects heretofore thought impractical/impossible on the Atari 8 bit. I'm not quite up on the technical aspects so i'll do my little cut and paste routine. :)

RMT - main features in progress

Mono 4 tracks / stereo 8 tracks.
254 tracks, each with its own length (max.128 beats) and with support for track loop.
64 instruments (stereo, instrument table up to 8 steps - 2 types and 2 modes with loop, instrument envelope up to 32 steps with loop, portamento, filter, 16bit bass, volume slide, volume minimum, vibrato, frequency shifting, etc.).
Fully automatic management of AUDCTL register (filters, 16bit basses) and note portamento up/down effect.
Instrument envelope commands for note/frequency shifting and support for special "like a C64 SID chip" filtering.
Up to 256 lines for song (with "goto line" support).
Beat speed 1 to 255 (1/50 to 255/50 sec).
Instrument speed 1 or 2 per screen (1/50 or 1/100 sec).
Main input/output song file format: RMT song files (*.rmt).
Input/output instrument file format: RMT instrument files (*.rti).
Export formats: RMT stripped song file (*.rmt), SAP file (*.sap), XEX Atari executable MSX file (*.xex).
RMT - download

Check out the RMT developement page for progress and some samples you can use on the emulators or 8 bit.

http://www.infos.cz/raster/atari/rmt/rmt.htm

## 259. atari++ 1.14 BountyBob, Sound

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-13 09:22:34 UTC
From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <avu0gq$9nt$1@mamenchi.zrz.TU-Berlin.DE>
Source record: 24167

Hi folks,

a new version of the atari++ emulator is now available for download at

www.math.tu-berlin.de/~thor/atari++

This is a free emulator for all *nix systems, and about the only emulator
I know that does horizontal timing emulation correctly.

New features of the 1.14 release:

- Extended emulation of various cartridge types (SDX,XEGS)
- Emulation of the 5200 BountyBob cartridge.
- Improved sound quality for Oss and ALSA.
- Highly improved sound emulation for SDL (simple direct media library).

The OssHQ driver will also accept ALSA emulation and will be able to
generate software speech on ALSA and Oss. SDL also offers now software speech
support.

I'm still looking for cart images to extend the emulation. Hence, if you've
a cart dump you want me to support, I'd be glad to receive your mail.

Further, I'm also looking for descriptions for memory extensions as this is my
next goal in the emulator development. Currently, it supports only the
additional memory banks of the 800XL and 130XE.

Greetings,
Thomas

Why not use the cartridge port? All Atari's have them and it leaves the PBI
free for other things.

Who's talking about floppies? I'm using a harddisk, a ZIPdrive and a CD
ROM. Now somewhere on these things I guess we could stash an MP3 file or
two. :-)

I saw a program yesterday for the C64 that will check a CD for errors. As soon as I've got the code, I'll try and write an Atari version for it. According to the C64 user/programmer/developer you can't check a CD under windows as it's not part of the regular code (still an attachment to the code).

Use binary buster to turn the program into a straight binary file and transfer
it onto a multiboot disk. Then use multiboot to create a bootable cassette.
Obviously this wont work for games that use the disk drive after initially
loading tho...

Then there's Transdisk which I haven't tried.

Joe,
I don't think Holmes (Aaron) has a problem with Steve selling the
CD's. If you have read previous threads on the subject, Holmes
(Aaron) already knows what Steve was planning to do and has had no
problems with his intentions (other than the fact of putting the name
Holmes up on his ebay auction). So I don't know where you are getting
this or why you are attempting to stir up trouble.

## 268. Wanted: Atari XL or XE & 1050 disk drive

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-13 17:02:37 UTC
From: rtdos@yahoo.com
Message-ID: <845192d9.0301130902.4f10242@posting.google.com>
Source record: 24176

A member of my group (whom shall remain anonymous but it ain't me) has
been searching for an Atari XL or XE (64K Min) and a 1050 or
compatible disk drive. Anyone have one for sale or suggestion?

## 269. Re: Wanted: Atari XL or XE & 1050 disk drive

Check eBay. There are usually several Atari 8-bit computers and floppy
drives up for auction at any given time. There are also a few retailers
who specialize in used equipment, but I don't have any URLs handy. Try
doing a Web search to find them, if somebody doesn't post with specific
URLs.

## 270. Poll: new LISP implementation for the Atari?

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-13 20:46:07 UTC
From: Carsten Strotmann <cas_news@strotmann.de>
Message-ID: <avv8bf$j9049$1@ID-174234.news.dfncis.de>
Source record: 24183

Hello,

I'm currently in contact with a oric (= 6502 based computer) user who has a
LISP Interpreter for 6502 processors he is willing to share with the Atari
community.

My question is: how much interest is out there in the community for a good
(and open, supported, documented) LISP on the A8?

If there is enough feedback, I'm thinking of opening a "real" project
instead of a "pet"-project just for me :-))

Best regards

Carsten Strotmann

---

Resources on LISP --> http://www.paulgraham.com/lisp.html
LISP Primer --> http://snaefell.tamu.edu/~colin/lp/
ATARI Inter-LISP/65 --> http://www.strotmann.de/twiki/bin/view/APG/LangLisp
more LISP --> http://babs.cs.umass.edu/lisp-resources/index.html

From the ORIC Lisp Manual

The LISP language was created in 1964 by John McCarthy in order
to process information organised as binary trees (math formulas, natural
language sentences, knowledge bases etc.). LISP represents those trees as
lists (by the way, LISP is an abbreviation for LISt Processing).

The ability of LISP to handle symbolic information has made it one of
the preferred "machine languages" in such fields as Artificial Intelligence,
Robotics, Formal Calculation, Programming Theory (e.g. program proving),
Game Theory, Syntax Editors (e.g. Emacs) and more generally Programming
Environments, etc.

To position LISP relative to other programming languages,
a distinction is usually made between three language families (although
some languages may belong to more than one family): imperative languages
such as Fortran, Pascal, Cobol, Basic, Ada, C..., in which a sequence of
instructions is used to reach a solution; declarative languages such as
Prolog which merely describe the problem to be solved (a deductive logic
is then used to reach the solution); and functional and application
languages such as LISP, ML, FP, where you apply functions in the
mathematical sense (i.e. there are no more "variables" in a program). Early
object-oriented languages such as SmallTalk may be regarded as being
derived from LISP. LISP also influenced the LOGO language.

Apart from this classification, LISP is comprised of a whole family
of dialects (InterLisp, MacLisp, VLisp, LeLisp, MuLisp, FranzLisp...),
which all share the following features:
- They compound recursive functions whereas traditional (imperative)
languages repeat assignment sequences.
- They handle tree structures, and there are program trees as well
as data trees (a program may therefore be processed by another program!)
- They are structured and modular (thanks to compound functions).
- They are interactive (they generally provide a language
interpreter
which lets you modify everything, including the interpreter itself!).
- Memory is managed dynamically and automatically (a "garbage
collector" reclaims the storage space used by data which is no longer
needed).

Hi,

LISP is not very interesting. I think a language as PASCAL but then a version that compiles to assembler code like cc65 does. This would be good. An ACTION! like compiler on the PC as cross-compiler would also be nice. Or a good Turbo-Basic like compiler that really creates assembler code not the output Turbo-BASIC XL 1.5 does....

>this or why you are attempting to stir up trouble.
>
I don't think his idea was to stir up trouble, I think he had good
intentions but may not have known all the facts. The fact he wrote
direct to Steve and not the group proves that.

He is dead right, the CD's do have read me's saying you are not to sell
them, Aaron may not have known at the time to take the file out or to
remind Steve not to use the Holme's name on the CD's.

I'd put it down to a simple misunderstanding tbh

>Larry
>

I've downloaded everything I could find on Micro-SPL. I believe there is enough information available to forward engineer the Micro-SPL compiler in to something that is Action! compatable. Granted, part of the magic of Action! is it's integrated editor/monitor/compiler. But I've often wanted an Action! compiler that is command line driven and would also have a cross-compiler counterpart on the PC.

Hmmm, I wonder if the Action! editor was written in Action!? The Action! compiler leaves a characteristic JMP fingerprint immediatly before local procedure variables so it wouldn't be hard to find out. If I had the time.

Back in the 80's I remember hearing a rumor that the editor was written in Action!, and that PaperClip for both the A8 and C64 were written in Action! and compiled on a A8. Gee, if this were true then I wish I had those C64 runtime library functions.

I wonder if Henry G. Baker, Jr. could help you in contacting Clint by giving you an email address?

The easist way would be to 'boot' use a Happy v.7.1 diskette and see if it responded. Lacking a disk, then open up the drive in the proscribed manner and check it for a Happy upgrade chip. If the drive is able to format in DDensity then this proves that it is upgraded, but not which upgrade. SpartaDos recognition with fast SIO could be Happy or ICD Doubler. I don't know if there is a direct poke or peek to detect a Happy drive. Although there might be a XIO command that could be interperted to be a Happy.

I think its a great idea. But to exceed the capabilities of the
Interlisp port the Atari already has, it will need some substantial
work on a compatibility library. It would be handy if it could
implement a significant part of Common Lisp- though to do so,
something virtual memory-like would probably be necessary.

Steve,

The cart space of a normal cart starts at $A000 if i remember correctly. There are a few bytes (6?) that lets the OS know on boot up that there is a cart installed, and special circumstances (i.e. boot DOS first, don't boot DOS ...etc..). Check out the hardware docs for info on the carts or the boot up sequence of them.

Have you taken a look at the PD Action! run time package?

If you do some back door calculations it turns out the compiler part
probably isn't as detailed as you might imagine. Specifically the run time
package which has all the routines found in the cartridge compiles to ~4k. I
figure the editor is probably as sophisticated as SpeedScript so take on
another 8k. That leaves 4k for the monitor and compiler.

The calling convention is really simple for the routines, just passes
parameters in the A, Y, X, registers and page zero if you need more. All
routines end with an RTS.

Anyway the run time package makes a good starting point. It wouldn't have
the syntax, looping, or logic functions but is still kind if nice.

Hi,

yes, that is on my list of things to do in life :))

One problem is that classical languages like C or PASCAL don't fit very well
into the 6502 architecture, and I'm not a specialist in compiler-building.

ACTION! was the best by code quality by now. Tom Hunt has (maybe) found the
origins of ACTION! (Micro-SPL, see post), but unfortunatly there is no
source to start.

If someone has spare time, it may be a start to research how the ACTION!
Compiler is working.

Additionaly, cm65 --> http://hem.bredband.net/b129764/Siders/CM65Main.htm
may be a start.

Carsten

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

## 285. Anyone compiling Atari++ for Windows?

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-14 14:04:08 UTC
From: Paul Irvine <mclane.dellosYOURFINGER@btinternet.com>
Message-ID: <al582vg682gsiv7hhckuesaj024i736vs1@4ax.com>
Source record: 24098

If not, why not ;-)

Seriously, I've spoken to Thomas who says that it's possible to port
with some work / knowledge so I'm hoping to spur some clever person
into making this excellent emulator spread to the dreaded Windows
platform.

Why some will ask, Atari800win Plus is excellent...

I totally agree (being a beta tester I play with it more than most)
but the emulator is missing some of the fine features of Atari++ which
may not be easy to add into the core without a possible full rewrite.

So, anyone up to the task or at least willing to try?

If you think so then pop to

http://www.math.tu-berlin.de/~thor/atari++/

And work with Thomas to give a wider audience another fantastic
emulator.

I could only think of B&C, Bravo Sierra, Best, or Video 61 but
couldn't think of others. (actually through an un-related google
search I found several 2600/5200 dealers that I've never heard of)

Message-ID: <3E24466D.A5C56F05@students.uni-mainz.de>
Source record: 24101

Hmmm,
I guess Numen uses Gr. 9 +11. To avoid the black stripes, Fox has
lowered the resolution to 80x48 pixels (instead of 80x96 pixels, which
is standard for non-interlaced gr. 9+11 pics)...

HIP or RIP both use Gr. 9+10 (because the GTIA bug which gives the
160x200 or 160x238 resolution appears in Gr. 10!); one picture uses
approx. 16kbytes when uncompressed; packers can reduce this on
disk/harddisk (but not in RAM memory!), alas, they are too slow when
unpacking. They cannot unpack 25-30 pics per second !! Just view a
packed HIP or RIP picture with Visage 2.5 and look how long it takes to
unpack just one picture... -Andreas.

## 289. Re: transferring atr to tape

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-14 17:44:01 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3E244C61.B39FB261@students.uni-mainz.de>
Source record: 24102

Well,
if the ATR image is a boot-disk (without directory, etc.), you won`t be
able to convert it to tape easily. however, if the ATR contains files
(Bas, EXe, etc.) you can use any D=>C Filecopier to convert those files
to tape. Load SIO2PC then boot a DOS, load in a Disk=> Cass. Copier (via
DOS!) and then setup the ATR image as D1:filename.atr; you should now be
able to load any file from Disk (the ATR image) and save it to tape
(connected to your real Atari)...

when done, 1) BAS files can be loaded from Tape via CLOAD <RETURN>, 2)
LST files can be loaded from tape via Enter"C:" <RETURN>, 3)
boot-ml-programs can be loaded with <START> or <START>+<OPTION> and
<RETURN< after the beep, 4) ordinary ML-files (COM, EXE, etc.) can be
loaded with a ML-file tape-loader (like BLC, COS, tapeboot, etc. )...

Just E-Mail me if you need a Disk=>Cass Copier or a ML-file tape-loader.
-Andreas.

## 290. Re: Atari 800 expandability, etc.

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-14 17:51:47 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3E244E33.C613C555@students.uni-mainz.de>
Source record: 24103

Well,
afaik the Atari 800 can have up to 4 Megabytes of RAM; an XL or XE Atari can have up to 16 Megabytes of RAM if it has 1 PIA chip (which is standard); if equipped with a second PIA chip an XL or XE Atari can have up to 256 Megabytes of RAM. But I have my doubts that anyone needs so much RAM or that there exists any A8 software that will use or support so much RAM...

Hmm, Diamond, since it was not very widespread around the atari community it will load all Diamond apps, but it will not load every non-diamond app. If you are lucky it does, otherwise it does not - you just have to find out yourself. But I think it is possible to write some drivers or patches for existing programs, so that they will load under diamond (alas, you have to write those drivers or patches yourself)...
-Andreas.

I do not have a problem with these going for $15 and it seems reasonable.
That is not what I meant nor the auction part. But Ebay takes a hard
postion against the selling of ROMS and suspends accounts, thus a risky
place to put them

I can't help but be amused at all the indignation over the sales of
this collection - at the end of the day it is a compilation of someone
else's copyrighted software and the notion that the person who
collected it together has some sort of control over it is pretty
absurd. It's a bit like saying you can't redistribute PD software
(of course, this isn't PD but then neither are the contents of ths
collection 'owned' by the collector).

Full marks and thanks to 'Holmes' for spending time collecting the
software and arranging the original website, but let's not forget that
he's not the copyright holder of it and that anyone else is as free
(or not as the case may be) to redistribute it or make it available as
he was.

I have sent Thor an email about this. I've been wanting to get more
involved in an emulator project (and I just got back into Atari 8-bit
stuff), so I'm taking a look at the source and will try out the emulator on
Linux tonight. Sounds like it might be a cool project, so I'll keep you
posted.

## 295. Large archive of Atari disks...

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-14 21:19:05 UTC
From: dunxuk@aol.com
Message-ID: <20030114161905.02096.00000296@mb-bd.aol.com>
Source record: 24107

Ok, I mentioned last year that I was 'auditing' my disk collection and making fresh copies of all my favourite programs.

Now I've done that and I've got about 500 floppies now that are going to go!

I was going to put them on eBay in five batches of 100 with disk boxes starting at ï¿½10 each (cheap - in the UK Atari disks are like hen's teeth, such was the stranglehold of Commodore), but I would like to offer the community here at csa8 first refusal before they get split up and go elsewhere.

So any UK members interested, email me an offer. Almost all are games, many of which were not on Holmes's site. In fact I was in the process of sorting out the ones to DCM and send to him when his site went down. About twenty are DD and most of those are Alphaloads with many games on each disk. There's multiload games, utilities, some sound and music disks etc. Piles of disks when you see them all in one place!

I don't feel good about advertising on this NG but I'd like to give the rest of the team here a chance of a shout before putting them on eBay. Please, no flames!

Would you like to email me an offer? If you are thinking of collecting them I'm in SW Scotland.

Dunx

I've only seen one mention of 'don't sell it' so I can't see where you
get 'all' from Gav.

All I've said as one of the many sources of material is that I'd have
preferred it on a web site as well. As for Aaron having control, no
but if it was me I'd like to think someone would respect my wishes for
all the hard work I'd done which *was* the case here.

Say the case was different and someone else was putting the CD's up
for sale *without* asking you who had spent years collating them,
would you not mind just a little?

It's a respect thing....Not an ownership thing...

> Full marks and thanks to 'Holmes' for spending time collecting the

Aaron has never made any comments against anything but he did ask if
it was possible to remove his name from the collection on ebay for
very obvious reasons.

Again, apart from one person who privately mailed Steve I can't see a
single note of uproar to be honest. It's all been fine and dandy.

I am not sure yet, I am taking that on an AS IS basis right now. Make a bid on ebay and when the auction is over I will look into it. I already have one person from Ireland that I have to look into.

To everyone else, I have six packages ready to be sent out (before I ran out of mailers). The whole package weighs a little less than 4 oz. I just need to find out what it will cost to mail them and pay it. Everything goes out on Thursday, the day the auction ends.

Holey Microchips!!! OK, which one is faster, the 800 or XE130? And where can I get this stuff?

> But I have my doubts that anyone needs so much RAM or that there exists any > A8 software that will use or support so much RAM...

True, but 512k might be usefull. Or I could make the 256 meg battery backed and use it for a ramdisk.

> Hmm, Diamond, since it was not very widespread around the atari

What about hard drives and/or 80 track floppies? Are the XE130's or 800XL's joystick ports bidirectional like the 800's?

And I have found that Atari800X for Macintosh System X is actually quite
good too.

You know, with System X being a unix system (BSD) anyway, I wonder if
Atari++ would have much difficulty porting? (Scratching chin).

Source record: 24129

FamilyNet Newsgate

Well, I'm back for a bit at least. After reorganizing, I managed to get my computer back online with a few tricks. :)

For those just tuning into the Atari 800 scene, here are some fun suggestions of things you can do.

Bear in mind that while there are things available to the Atari 8-bit world, some programs don't readily work on the Atari that would say work on the XL or XE. Mind you, being a big fan of the Atari 800, I am willing to make that sacrifice.

First off, looking for a hard drive? Try the MyIde that Mr. Atari is selling. I have a slightly different one in use, a prototype, but still great to have a hard drive to bring the computer up.

Secondly, if you get to where Ice-T is not enough for you, you could always try networking the Atari computer through a null modem linkup. With this (that I discovered by accident) you can log into a local BBS (yes they still exist in some areas) and type on the Atari 800, and if connected right, you can type on the Atari 800 and see the text and see the text also on a PC or ST screen. (ok, ready for this... get one of those blue laplink cables.. with two connectors on each end. Then with the appropriate null modem connectors and pin adaptors set it up so that...

End one
nine pin connector - pin adaptor - Modem 25 pin connector - Cable to 850 interface

End Two
9 pin connector - pin adaptor - null modem - cable to PC 25 pin connector- Empty

Discovered this by accident, used it for years.. would love to know why this works, and would pay $20 to the first person to tell me how to get this talking to a Mac this way...) ;)
With the PC or ST using better programs more suited for reading 80 column and Ansi (or Ripterm even) the BBS activity is interpreted for the BBS'er while still getting to enjoy controlling it all from the Atari 800's cool keyboard.

Third, VGA! Sure you could use a RF connector to a TV. Not a bad start. And if you get a video monitor, the Atari 800's video port is amazing. To matter the fact, S-Video is easily converted so I've been told. But another fun alternative is to find a Macintosh Quadra 660A/V or some other audio/video Macintosh. You can pick these up for cheap now days since schools are unloading these to make room for newer computers (these computers came out in

1994 so you can't blame them). Hook up the A/V Mac to a VGA monitor, and then the Atari 800 to the video in port and the audio to the single channel microphone port and whammo! You now have game playing ability of the Atari 800 on a VGA monitor.
(Natually I have seen another friend do this with his video card on his PC, but being able to do the same for a $10 computer from a sidewalk sale is simply sweet!)

So that's what you can do with a Atari 800. Any questions? :)

Source record: 24132

FamilyNet Newsgate

My next big task in the Atari 800 world will be to hook up a Star 10
graphical printer using the Xetec "graphics AT" printer card.

I managed to get the printer card hooked up to the Star 10 printer attached
to a Atari 800 originally from the first Saturday sidewalk sale. Unfortunately,
no software attached. Anyone have any experience with this bit of printer
adaptor, and have the software for it? Be willing to trade perhaps some game
for a copy.

Thanks!

## 308. Connecting Atari 400 to TV set

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-15 05:21:52 UTC
From: "Frederick R. Hanhisalo" <FredH@hiraethcelticgoods.com>
Message-ID: <Qd6V9.7793$Fj2.4305951@news2.news.adelphia.net>
Source record: 24116

I have an Atari 400 with a TV/Computer switch box. It works when I connect the Atari to the antenna input on the TV through the switch box but the image is poor.

The cable on the Atari ends with a phono jack and there is a similar jack for video in on the TV. Unfortunately, when I connect the Atari directly to the video in jack on the TV I get a blank screen.

This happens with two different TV sets. It also happens with a Radio Shack Color Computer (which also works with the TV/computer switch box).

I've searched the Atari and CoCo FAQs and web sites with no luck. I did read of one person who burned out the TV card on his computer so I'm reluctant to experiment further.

Can anyone tell me the best way to connect an Atari 400 to a TV?

TIA,
FredH

## 309. Re: Connecting Atari 400 to TV set

From: RoyE <r-dean@charter.net>
Message-ID: <v29vmp4q0o0vc8@corp.supernews.com>
Source record: 24117

Frederick,

The 400 doesn't have composite video, just the rf through the rca jack to the tv switch box. If the tv has an rca plug it is for composite video and not the antenna. The 800 and xl series Atari's have composite video thorough the monitor out plug. There has been several Clearpic mods done for the Atari but I haven't heard of one for the 400, but I have tried several different rf switch boxes and have had some luck with the Radio Shack switch box, the earlier Nintendo switch box. Search the internet for atari clearpic and atari mod. I know that the 5200 and the 2600 can have a composite video hardware hack to fix blurry pictures.
Good luck, someone else will be glad to help point out other things that you might try also..

>
>
Well, my latest idea was to use GR.9+11, at 80x192, first frame goes
GR.9-GR.11-GR.9, second frame goes GR.11-GR.9-GR.11, third frame goes
GR.9-GR.11-GR.9, etc. And no picture is a repeat of the previous one,
taking advantage of the fact that abrupt transitions from one frame
to the next are not too likely. You know, some sacrifices need to be
made.

OK, a GR. 9 or 11 80x192 picture takes (80 pixels/line*192 lines*4 bits/pixel)/
(8 bits/byte)=7680 bytes. Can an A8 load 7680 bytes from disk in 1/30th of a
second? Can some sort of cache be used? With let's say 48K reserved for cache,
you could store 6 fields in advance (I'm talking 'fields' instead of 'frames'
because actually, each picture would only be a half-frame, technically,
"completed" with the information contained in the next one). So we'd end up
with actually 15fps. Let's see: SIO transfers at 19200bps (which translates as
2400 bytes/second, and we'd need 230400 bytes/second), so it definitely has to
be discarded as a way to read the 'video' files since it's too low. PBI, OTOH,
is faster, but is it fast enough? Can it at least achieve 115200 bytes/second?
I'd be willing to believe it can...

At least not over the serial port with a 1050 attached to it. You would have
to have a harddisk that loads data directly into the memory, at best by
using DMA.

> Can some sort of cache be used? With let's say 48K reserved for cache,

PBI with DMA would be fast enough, I suppose. Excuse my ignorance, but is there
an existing PBI hardware for that?

So long,
Thomas

Great, thanks!

I plan on getting my hands around a 600XL or 800XL whenever I can (anyone want to trade me for something?) and a 1050 FDD, so that'll be handy to know.

Also, another question: I have been told that the 810 and 1050 will store 88K per side on single density disks. I know better than to try and use DSHDs, but is it safe to use DSDDs as single density? It won't shorten the life of the media too terribly, will it?

Thanks!

Yes, those are best. The 1050 writes some DD sectors when using enhanced
density anyway. Don't forget to notch them so you can use both sides!

My disks have lasted 20 years with no sign of fading yet, I think you can trust
them!

> RoyE
>

Except that SpartaDOS doesn't do Happy drives... The Happy will not
accept an Ultra Speed sector skew nor the command, which causes a
serious error to occur within the Happy and from that moment on the
Happy will always kludge the third byte with 82h thus ruining each
and every sector written to using Sparta. SDX is a different critter,
and even with that DOS you'll need to load a Happy drive patch to
use a Happy with it. I'm not sure if there was a patch for standard
disk based SpartaDOS or not, or even what it's file name would be.

The main point is that the Happy doesn't co-operate with Sparta and
its 'high speed' routines at all. The Happy doesn't need to though,
its got the whole track in memory and spits it out faster than a
US Doubler drive will anyway. You can read a Happy with Sparta all
you want, just don't write to one without some program running
interference for you or its kludge city.

I believe if you send a Happy the command 'H', it will return with
no error which means 'yes, I'm a Happy drive'.

Source record: 24124

Yes, indeed!

Before I lost my mind and let my Ataris go, my first 8-bit was a 1200XL w/two 1050s. Well, some of the disks I inherited from people were copyright 1979 Atari corp and they were as good as new (almost literally). That made the disks 18+ years old at the time.

Man, was I a fool! I should have let some of my PCs go! I had four 1050s, a 1200XL, three 800XLs (one mint in box and two for parts), a dead 130XE and the drive that went with it (I think it was called XF551 or something to that effect). This is not to mention various peripherals, cables, etc. and hundreds of disks.

Ah well, back to the proverbial drawing board (or graphic tablet as the case may be).

Thanks again!

Howdy Thomas

> PBI with DMA would be fast enough, I suppose. Excuse my ignorance, but is there
> an existing PBI hardware for that?

BlackBox, MIO, MSC-IDE interface, Supra harddisk interface (a.k.a. KPI Interface), MyIDE and I probably forgot a few.

CU Mathy van Nisselroy

PS I'm not sure but how much overhead is there in the individual interfaces? Maybe ASPI can help. ASPI talks to the harddisk interface directly. ASPI is like a harddiskhandler. Just like you load a different RS232 port handler for each RS232 interface, you load a different ASPI manager for each harddisk interface. Unfortunately, the only APSI manager available at the moment is the BlackBox ASPI manager. Check out my ASPI page at http://www-users.rwth-aachen.de/mathy.van_nisselroy/aspi.htm

## 320. FS: Atari Apple Mac Commodore Classic computer stuff...

Newsgroup: comp.sys.atari.8bit

Hi All...

Please check out my page of Classic computer stuff for sale...

Apple II
Atari
Macintosh
Commodore
PC

My basement is full and it needs to be emptied...

This stuff has to go... No reasonable offer refused...

It either goes to the Post Office or the Recycle center...

I have Atari books, Compute Magazines, etc.

http://www.atariuniverse.com/forsale

Thanks for your cooperation...

Rory

It's a figure of speech. The subject has spawned a lively thread so
there's clearly some debate over the rights and wrongs.

> All I've said as one of the many sources of material is that I'd have
> preferred it on a web site as well. As for Aaron having control, no
> but if it was me I'd like to think someone would respect my wishes for
> all the hard work I'd done which *was* the case here.

At the end of the day he's collected a load of software which he
doesn't own the copyright to. I applaud him for his dedication and
thank him for doing what he did, but no-one made him do it and as far
as I am concerned anyone else is as free to distribute the software as
he was to have made it available on his website.

> Say the case was different and someone else was putting the CD's up
> for sale *without* asking you who had spent years collating them,
> would you not mind just a little?

I think I'd be realistic enough to know that if I didn't actually
own the rights to the software I was collecting together and
distributing, I wouldn't really have much control over what happened
to the collection after someone else got hold of it.

> It's a respect thing....Not an ownership thing...

I can't see how selling the software collection shows disrespect to
the person who compiled the collection - disrespect to any copyright
holders perhaps. For the record: My personal opinion is that I'm OK
with people distributing 'pirated' software which is no longer
available but I certainly don't think people should make a business

out of doing it.

I don't know if this character was intending to make money out of the CDs, if so I don't have a lot of time for him. But I also don't think that it's somehow wrong to do it because the person who collected it has some sort of residual right over it, which seems to be what you're saying.

Actually, I'd rather see people putting the collection up on the Peer to Peer networks for others to download 'for free'. I got hold of all the 'mega discs' off his site before it closed and when I get some time to reorganise my HD I'll do just that (on the eDonkey network if anyone's interested). If anything, mentioning the pseudonym 'Holmes' at least gives some credit to the collector for his work. I'd be against putting details like the real name or address in there though.

Gav

There's been 1 person saying don't do it at all and everyone else has
been fine. Tbh you are the most animated over it :-)

Aaron has not said a single word other than I'm happy..

Steve's only had one against afaik and so far the comments have been
positive.

I'd say 99.9% are happy people :-)

Pass, me and Unix have never met ;-)

I really am hoping that Atari++ can be ported, with Plus somewhat
sidelined and a complete redo of the Atari800 core to match what
Thomas has done I think the immediate future of Atari8bit computer
emulators is there with Atari++.

Who knows what the future hold tho, maybe the core guys will / have
rewrite the core..

Seems we're a go to get this off the ground. I got some info back from Thomas, and he's all for it. Also, he's given me a few things to take note of when starting on the port. The hope will be to create a common code base that will build for any supported platform based on make-time switches, like a lot of the other distributed code bases.

Can't wait to get started!
Slor

The RCA plug on the Model 100 carries RF, not composite video. At Radio Shack
you can get an adapter to connect an RCA plug to the RF input on a TV.

I had this printer adapter a long time ago to hook up a Star NX-10 to my Atari 800XL. To my memory, there was no software with the device at all - just a need to set jumper switches appropriately. There's a tiny possibility I still have the manual from it stashed away somewhere. I can look when I have the time if that will help.

Hi Dr Clu;

Are you referring to the little box with DIP switches and SIO cable? That printer interface included some circuitry for dumping A8 control graphic characters to Epson compatibles and a few other printers of the time. It also had a mode for passing all escape codes and bit maps direct to the printer.

I never saw any software or drivers for it; there were DIP switch configurations for Gemini and Star SG-10s. You may need to reassemble Analog's G:Colon Device for your particular hardware parameters.

## 338. Re: Xetec: Graphics AT Printer Card

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-15 23:49:51 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <zsmV9.12291$Qr4.1214811@newsread1.prod.itd.earthlink.net>
Source record: 24051

Hi Clu;
Here is something few months back from the mail-list:
<<Hi, Jim;

Eight DIP switches numbered 1-8 left to right.
Up is on; should be marked near switches.

#1 is Graphics control:
ON prints text, converts control graphics (<32 and >127) to ATASCII shapes.
OFF passes all text and codes to printer transparently.

#2 is Auto Line Feeds:
ON adds a line feed to each carriage return.
OFF sends only the return from the interface and relies on the printer to supply the line feed.

#3 is End of Line conversion:
ON passes the 155 unchanged; preferred OFF without extraordinary circumstances.
OFF converts the ATASCII 155 EOL to a 13 printer carriage return. Normally preferred.

#4 is 7 or 8 Bit ASCII:
ON converts all data to 7 bit by setting the high bit to zero. Prohibits printing inverse (>127) ATASCII graphics, and is only needed with some old software which sets the 8th bit to one.
OFF passes all 8 bits as received.

Xetec recommends setting #1- #4 OFF for all packaged software; exception may be #2 if printer is not configured to give line feeds.

#5 - #8 are Printer selection control; 18 specific models were listed with appropriate settings. Epson, Gemini and Star models set 5, 6, 7, and 8 to OFF; all non-graphics daisy wheel types set 5-8 to ON. Okidata sets #5 ON, NEC/Prowriter sets #6 ON, Legend/Blue Chip sets #7 ON, Axiom/Banana set #5 & #6 ON.

Special Codes to interface in Graphics mode SW #1 ON.
ESC 6 selects 6 lines per inch
ESC 8 " 8 lines per inch
ESC T selects transparent mode as if SW #1 OFF
ESC G select graphics by cancelling ESC T
14 (Ctrl N) select expanded width characters
20 (Ctrl T) select compressed width characters
15 (Ctrl O) cancel expanded and compressed widths
*Note: may not function with all printers.

Use with 1200XL requires modification to supply +5V

Ah Ron! I should have figured you would reply on a printer question. :)

Well thanks for the forward. So to the best of your knowledge is any
software needed to be loaded to drive the xetec printer device?

For that matter, how DO printers tend to work when you go beyond the SIO
specifically designed printers? I have the Xetec device, and a 850 interface.
Honestly while I have managed to print out of port #4 on the 850 for some fun
tinkering in basic, most of my printer (atari) experience is on say 1025
printers. :)

I'm very new in this area.

Thanks,

Doctor Clu

Hey, always a pleasure to meet up with other 800 users! (And to meet those willing to use a computer old enough to vote.) :)

Well, since I am currently on an Atari 800 and the telnet site that I use for web browsing has turned off telnet I'll have to find out that answer on the MyIde site when I am on another computer. :)

In the meantime, try "MyIde" on Google and see what it tells you. Nice having a hard drive on a computer that traditionally did not have any idea of IDE initially.

MyIde, like many other standards, takes a hard drive, divids the drive into up to 16 meg segments which you can access like regualr drives. The rest of the space on the drive aside from the drive partitions is used for disk images that you can select and load by using special key commands and a joystick.

One of many good hard drive solutions, and cheap. :)

The manual I got. I guess I'm just doing some fact finding right now and gathering experiences. So any idea what programs you used it with? Does the interface emulate an existing or better known printer?

This is a STAR SG-10 printer. Man I would love to print graphics on the Atari 800... heheh... something I always wanted to do from the 80's...

IIRC, there were two versions of this printer interface, and the DIP switch settings were entirely different from one to the other. The two looked identical from the outside, so I hope Dr. Clu can retrieve the manual for his particular interface.

As others have pointed out, the 400 was limited to RF output. And to add insult to injury, the RF output on Atari computers is pretty poor. However, depending on your skill level, you may be able to add composite video-out to your 400.

IIRC, there was an article published in one of the Atari magazines around 1983. My recollection is that it was in ANALOG, but I cannot find it. Perhaps someone else can remember this and provide a better reference to the actual article. (OTOH, you might be better off picking up an 800 XL or other better-featured A8 model.)

Good Luck,
Larry

Hi,
I think that you need to download one of the zip files, extract contents and
read the text info... for parts list.. or the parts list might be added to
one of the image files with the schematics.
Good luck
RoyE

I'm fine with it, as I 'know' I have no legal rights to the CD's (some of the files are my own creation though! Not that I care.), Steve has my blessings to sell the CD's at cost. Any profit made is up to him, and I take no responsibility for the CD contents or the selling of such for profit.

So there's no problems anywhere from this end. If I had concerns about 'my work' spreading, I'd have never released it to anyone. My intention was that as many people as possible 'would' have access to those files, thus why I had a website for 5 years+. Anyway go boot your Atari and have a game of Boulderdash or something, that's what Atari is all about, having fun!

Hmmm, I'll try to convert one of those 20-second Star Trek MPEG promos
I mentioned. I was just thinking, the MPEG files are about 3MB. That is
for 20 seconds, 30 fps, 352x240 pixels per frame. Converting them for
the Atari, at a resolution of 80x192, 30 fps, 20 seconds would take
almost 4,5MB! But of course, we wouldn't be using any compression...
And if we are forced to use 15fps, size would go down to 2,2MB...

Now, where did I leave the formula for converting between RGB and HSL?

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. I can afford to sell for less because I keep overhead down, I avoid going into debt and I avoid making promises I can't keep! This includes not offering services that I cant follow up with! So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Atari's a New Good Home! So I'm involved in saving Orphaned Atari's from Atari Heaven! Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org Or goto my Domain at http://BenSells.Atari.org or Call Ben@(503)256-9974! http://www.aracnet.com/~atari/numbers.htm Calling Hours and Info:

Taking about compression, how big would that be when zipped.

At the moment I have the new drivers for my Canon Printer here on the
server. But I haven't figured out how I'm gonna get that home, since it's
2.9MB.

What piece of software (that I do not have to install on the computers here
at the U. The administrator doesn't want me to do that.) can I use to chop
up big files into small enough pieces so that I can put them on a floppy?

Howdy folks

I've found the schematics to a video digitizer. It's for the CoCO3 but
maybe somebody can convert it so we can use it for the Atari 8 bit too.

Check out:
http://www.nickm.launch.net.au/CoCoWorkshop/digiscan/digiscan.html

scroll down to the pictures of the VW Beatle and R2D2. Then go up to where
it says "Theory of Operation - digiscan software" Just over that you'll
find the link to the schematic.

CU Mathy van Nisselroy

BTW I one read something about a 4096 color twin ANTIC mod by Bob Woolley.
Anybody know anything about that?

Source record: 24070

Hello All,

I still have a number of eBay auctions running for some very good Atari 8-bit items, which are due to close over the weekend. The items are: copy of 'Mapping The Atari (Rev Ed)', complete near-mint set of European 800XL manuals, 5 issues of Atari Explorer (1989/90/92), an Atari Light Gun, 1050 dust cover, couple of general 6502 books, and an 800XL and 130XE keyboard for spares. The link is below (this will split on to two lines, so please copy both lines into your browser):

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=deangar raghty

Let's see... I used Bank Street Writer for word processing, and I think I used Print Power for banners, cards, etc. That was probably as much graphics printing as I did with my XL. I don't remember ever having to give the Atari programs any info on what type of printer I was using. I do remember that when I put the printer on my PC most programs had only a driver for the SG-10, and it worked fine.

Don't know if that helps any, but it's about the end of my knowledge on the subject!
Slor

I'm talking about floppies for one. I still love my 8bits (have 3 of them, 800, expanded 600XL and 130XE) but I dont have hard drives for any of them much less a cd rom on them. 8bit hard drives are harder to find now although I do remember seeing something similar to sio2pc that allowed a bare bones XT clone to function as a file server of sorts, sort of like a big drive from the atari's point of view.

No problems, we've known all along that moving stuff between US and Europe means a mains power adapter. Assuming about 50 watt average for the primary stuff results in about 200 watts at 120 volts( the 1010 is negligable). The best idea, mentioned elsewhere is to take a TV or monitor along, using its own power adapter.

> What about the Diamond graphical operating system? Will it work with
> non-Diamond apps?

Which is better..depends on who you ask. The 800 has 4 joystick ports so is good for multi player games. The XL/XE can run newer programs than the 800, and are slightly faster. Because of the Parallel ports, the XL/XE have the potential of accessing a lot of new fast hardware the 800 can't touch. While the 130XE had 128K built in, the 800XL was the usual choice for upgrades because it frequently had socketed chips. The 1200XL was popular for upgrades due to extra space, but the OS was 800+, not XL.

For any of the computers, the normal max ram using easy upgrades is 4 megs...(16384*256, one bank times one control port). Have 2 ports, then how about 1 gig, but the control is a lot more dificult. And very little commercial software uses more than 128K extra.

Diamond GOS...only apps that know its there can use it. Non Diamond apps will most likely lock up the computer..memory conflicts.

With out sources, impossible. And don't forget that any one PC driver can use as much memory for code and tables as in the total A8, most go much larger than that. As another post says, best to get a linux open source driver, at least for a start.

And with the parameter -e0 i will just archive (without compressing) the file,
which is faster. Let's see... it's been a while, but I think I used pkzip -e0
-& a:\filename.zip {your source file here}

Of course, for compressing several files and spanning disks, I'd use instead
pkzip -ex -&rp a:\filename.zip *.*

Howdy folks

But the problem is that the file needs chopping first. It's zipped already. 2.9MB. So I'll have to either chop the zipped file or unzip parts of it and rezip them into smaller zipfiles.

Howdy folks

I've used the following piece of Atari BASIC code to test how fast a file can be loaded:

```
100 ? CHR$(253)
110 FOR X=0 TO 99
120 XIO 39,#3,4,0,"D1:DUP.SYS"
130 NEXT X
140 ? CHR$(253)
```

A stopwatch was used to determine that MyDOS 4.5x needs just under 50 seconds to load DUP.SYS 100 times.

(If I load DUP.SYS one time, the influence of me pressing the button incorrectly is far greater then when I load DUP.SYS 100 times. This is a technique commonly used in mechanical engineering.)

This means DUP.SYS needs half a second to load. Since DUP.SYS is 27 double sectors long, it's at least 26x253+1 equals 6579 bytes in lenght. Meaning the Atari can load atleast 2 times 6579 equals 13156 bytes per second. Multiply this number by 10 to get the baudrate.

I do know that just loading a file that will not run doesn't compare to what's needed for real time video, but this is all I can test right now.

Use Whitsoft File Splitter 4.5a. It is a stand-alone program (i.e. no
installation necessary) and is very fast as splitting / combining
files. Grab it here http://tewem.tripod.com/download/Splitter.zip or
just do a Google search. Hope this helps.

Err well,
I do not know any commercial vendor that still creates/builds Ramdisks
(or RAM enhancements) today - thus you have to do it yourself. Use the
docs and schematics which can be found on various websites (I can also
send you some docs, if you want).

Joystick ports ?!? Hmm, I think they are the same in both computers,
except that the 800 has 4 ports whereas the XL and XE computers merely
have 2 ports. Harddisks? You can attach them via the XL parallel bus (or
cart.port+ECI on the 130XE), for example the black box made by CSS/Bob
Puff. Or via the cart. port, like the My-IDE interface made by Sijmen
Schouten. Or via the SIO port, like the SIO2IDE project... Read the
A8Faq by Michael Current to get more information about these hardware
items (and to look for the URL`s which I don`t know at the moment). Or
ask the gentle Atarians here to point you to the correct URL`s...
-Andreas.

> I'd be willing to believe it can...
>

Hmmm, somewhere I have read that the PBI could transfer approx. 100,000
bytes/second, so it is still slower than required. On the other hand, it
seems like the 100kb/s is only a theoretical issue, most harddisks
attached via the PBI work with 30-50 kilobytes per second (reading) and
10-30 kilobytes per second (writing). Afaik the PBI (and harddisks
attached to it) is/was the fastest data transfer to date. But maybe
flash roms or flash (ram) cards are even faster - I don`t know. Anyway,
I don`t think realtime video (MPEG or whatever) is possible on the A8. I
think there has to be some pre- calculating, converting, etc. before you
can show any video animation. thats what most polish demo makers have
done, they converted the ani to an A8 format, compressed it and copied
it to the ramdisk and then loaded it from there. There are some good
packers/compressors for the A8 (like the DJ-Packer and such) but they
are much too slow when unpacking a picture to use realtime video
animation... -Andreas.

Yeah. Disk access and DLIs aren't the easiest to do, either. :^)

> I don`t know. Anyway,
> I don`t think realtime video (MPEG or whatever) is possible on the A8. I
> think there has to be some pre- calculating, converting, etc.

My point wasn't to try to decode MPEG on the Atari. :^)

I want to convert the MPEG down to exactly something the Atari can use,
and use quickly (e.g., small resolution, etc.). All the Atari would have
to do is load it off (hard or RAM)-disk and throw it into memory.

> before you
> can show any video animation. thats what most polish demo makers have

Hello folks,
some weeks (or months?) ago architects, designers and politicians had been talking about a new WTC building for NYC. Many plans, photos, models, etc. were shown - none of them impressed me! My idea: Let`s design a new WTC building in the form of the well known Atari-Fuji-logo. How about that ?!? We have already seen dozens of conversions of the fuji-logo on various computers, handhelds and consoles. Me, I prefer the 3D logo as seen in the Atari Jaguar version of missile command 3D (right at the beginning!). Ok, a really crazy idea, but how do you think about it ?? -Andreas.

## 382. New eBay auction - V.RARE set of Atari UK I/O magazines

## 384. Holme's Web Site CDs sent out

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-17 21:40:29 UTC
From: Steve S <j70141@hotmail.com>
Message-ID: <3e287589$1_8@news.teranews.com>
Source record: 24096

I have sent out the Holme's Web Site CDs to everyone that wanted one that has already sent payment to cover the costs of making the CD and sending it out. On the second CD alone, the burner counted 34,800 files on it. That's a lot of Atari Programs and I doubt anyone will use all of them at any one time.

The CDs themselves are guaranteed, if you have a problem with the CD, send it back and I'll burn you another one. The files on the CD however, are not. I cannot guarantee that everything that Holme's sent to me will work as I myself have not even tried them all. If you read the "readme" file on the CD, it says something to that effect.

So far, 16 total have been sent out. I am holding two while payment is coming in the mail. I still have not heard back from 13 people so far that have made a bid on the CDs.

I ended up buying out our local OfficeMax of all their mailers, but I will have everyone know that I used 100% recycled mailers. =)

A very large number of you seem to prefer payment through paypal and so though I resisted at first in accepting payments through paypal, I have finally relented and have started taking payment by them. So.. if you want some of the CDs and have not made a payment to help cover the costs of burning them and sending them out, you can do so through paypal now.

I found one of my own games on the CD too, one that I created some time back in the 1980s. If anyone can email the name of it to me, I'll send them a package of free CD Coasters (spent CDs, failed to record properly).

Hint: It is a cheap clone of another game called "Type Attack", and it has my name on the title screen.

p.s., I don't expect anyone to want the free coasters =)

## 386. My IDE? Comments please

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-17 23:29:18 UTC
From: Pockets <jp@pockets.dummy.cix.co.uk>
Message-ID: <b0a3ke$cqk$1@thorium.cix.co.uk>
Source record: 23999

I'm thinking of getting myself a My IDE interface in the near furture

Those of you who use it, any good?

Note i'm a game's player at heart rather than a utility and programing person. I was attracted to Atari because of the disk and cart formats (and star raiders) so would i be able to boot games from the hard disk?

Also is it any good with a 3 1/2 floppy for such? Can 2 devices (floppy and Hard disk) be used at the same time. Can 3 1/2 floppies be made bootable/multidisk bootable.

I don't want to splash out and then find it doesn't do what i would like it to do.

Ta in advance, JP

Hello,

so far I see some interest for LISP or Scheme on the A8.
I will start this weekend to evaluate what is possible.

Thanks for all the offers to help, I will come back to this :)

As far as there is something to show, I will post it here. If the
project went on, I think there will be some kind of project page to
follow it.

Keep tuned

Carsten

> Itï¿½s character-based graphics + DLIs.

My game "Gem Drop" uses Graphics 12 mode and, without DLIs (just VBI to change the font; the colors stay the same, too!) is able to display a dozen or so colors.

That's similar to what I want to do to play converted FMVs (like MPEGs).

Additionally, however, I was thinking it would be cool to give each frame its own color palette. (So each frame can have its own UNIQUE set of a dozen-or-so colors.)

The data used to display a frame would be simply a chunk of raw pixels, plus 4 or 5 color palette values. (To 'POKE' into 709-712)

-bill!

## 389. Re: Xetec: Graphics AT Printer Card

I believe the SG-10 is supported in the group of Epson/Star compatibles with switches 5 thru 8 all off. You should have access to all A8 graphics utilities as well as Basic listings with inverse and control characters.

Source record: 24003

The Xetec is a hardware solution; to the best of my knowledge, it had and needed no software to access the limit of its capabilities. It is an Atari SIO to Centronics parallel interface which replaces both the 850 and printer cable; it plugs into the daisy chain and the printer.

The Xetec has the added feature of trapping certain character codes in Atasci mode and replacing them with the bit image of the character shapes rather than sending form feeds or other undesirable data.

You will still need software like Print Shop or equivalent to easily create faancy graphic printouts.

Port #4 of the 850 must have been a serial printer... the 850 also supplies a parallel printer port requiring a slightly non-standard 15 pin cable for connecting what became standard parallel printers of the early to mid-eighties.

One thing you *will* need to configure is the interface/printer line feed option because most other computers used a CR LF combination whereas the A8 uses a single EOL which is normally converted to CR only and all lines print on top of each other...

Source record: 24004

I was thinking of getting it but don't know enough myself. I am thinking instead of making things more convenient it might make it more difficult. Example I play universe and ultima 3 and not sure if running these as .atr images from the hard drive will cause any problems? I have the dual unit Astra 2001 double density drives and this seems to satisfy my needs along with writeatr and disk communicator 3 and a 5.25 PC floppy. I typically use writeatr to create double density compatible disks on the PC 5.25 floppy than can be read in my astra drives. If it is a single density .ATR image then I put the .DCM format of the .ATR onto a double density .ATR image that I then use to writeatr to the PC floppy which is compatible with the dual density astra. On the astra connected to my real atari I then use the diskcom 3.0 to make the real single density disk from the .DCM file on the double density disk. It's also convenient because the astra 2001 is a dual drive unit so it minimizes having to swap. I also don't have to use any specially created cables for this setup. Just a regular 5.25 floppy along with writeatr and diskcom 3.0 allows you to do pretty much everything you could want. It might be nice to know how well MyIde works with a program like Omnitrend's Universe that uses 4 disks.

You can zip a zip file, it just won't compress much, if at all. It will
split it between disks if you use the -& parameter.

Or as I said, use the -e0 parameter so it won't attempt to recompress it and waste time...

Well, that's another problem... I wss thinking of a buffer to read some 6 frames in advance, we'd require fast page flipping then (which isn't that much a problem) but a couple custom DLs (first one alternating GR.9-11-9-11-etc., the second GR.11-9-11-9-etc.), and quickly flip the six loaded frames, odd-numbered ones on the first DL and even-numbered on the second one.
Can we rely on the PBI's speed to do the actual loading during the VBI?

>to do is load it off (hard or RAM)-disk and throw it into memory.
>
Ditto. Hence I was speaking of converting MPEGs and how the converted files (uncompressed, so they are loaded directly into the 8-bit's memory) would apparently be larger than the originals...
Also that's the reason for my comment "Now, where didd I place that formula for converting from RGB to HSL...?" since the frames extracted from an MPEG video would initially have the color information stored in RGB format, and in order to have the 8-bits properly display it on their screens, we'd need to extract Hue and Luminance values (and in some cases, Saturation values, let me explain all that later), since that's what our 8-bits use after all...

Imagine a cube, where the 'origin' of a coordinate system is set at one corner, then the three axes X, Y, Z would each one correspond to R, G and B. Let the origin be labeled '0, 0, 0', and the diametrically opposite corner of the cube '255, 255, 255', '0, 0, 0' would be black and '255, 255, 255' white, any points along the diagonal linking them would be shades of grey '255, 0, 0' would be bright, light red, '0, 255, 0' similarly a very light green and '0, 0, 255' light blue. That's how 24-bit colors are being encoded.

Now imagine you're watching the cube from a point lying on the same axis as
the aforementioned diagonal, then you'd perceive it as an hexagon (omitting any
distortion produced by perspective, of course, just imagine an isometric view).
The center (through which the diagonal runs) would be our reference axis. The
distance (radius) at which a given point is from the axis is the saturation.
Now let's take a plane which passes through '0, 0, 0' and to which this axis
is a normal, this will be our plane of reference. The distance at which a point
is from that plane would give the luminance. Let's also take the projection
of the 'R' axis on the plane of reference, then the angle measured from that
projection would give the hue. I've simplified it a bit, but that's more or less
how it is. The Atari 8-bits use only hue and luminance values, luminance
going from 0 to 15 and hue from 1 to 15; a hue value of 0 corresponds actually
to the particular case when the saturation is 0 and you have a some shade of
grey, white or black. On the PC, brightness values tend to go from 0 to 255,
so to convert them for the 8-bit we's simply drop off the lowest 4 bits (in
other words, do an integer division by 16). But hues tend to go from 0 to 239,
with 0 being red. What can we do to convert them for the 8-bits, where red has
a hue value of 4? Let's see, if we also divide by 16, we'll get a value between
0 and 14, then add substract it from 18 and it's a number between 4 and 18, take
the result modulo 15 and again we have a value between 0 and 14, now let's add 1
to the result. Let's try with a value of 0, which would be pure red: 0/16=0,
18-0=18 MOD 15=3+1=4 and that's it, we have 4, the Atari's hue value for red.
Let's try a PC blue, with a hue value of 160: 160/16=10, 18-10=8 MOD 15=8+1=9,
which is our hue for blue. Let's try a green value of 80: 80/16=5, 18-5=13 MOD
15=13+1=14, there's our green. How about a yellow value of 40? 40/16=2.5, 18-2=
16 MOD 15=1+1=2 and there's yellow. Instead of an integer division we could use
rounding, so 2.5 becomes 3 instead of 2, 18-3=15 MOD 15=0+1=1, which may be a
better choice. Cyan at 120? 120/16=7.5, 18-8=10 MOD 15=10+1=11. Magenta at 200?
200/16=12.5, 18-13=5 MOD 15=5+1=6. So that's how I'd first convert the MPEG
videos to something the 8-bit could recognize.

Ok thanks for that!

But where is this software.
on your FTP server I can download those midifiles; that's great. And I found some tools too, but I need:

MIDIPL13.COM
MIDIDEMO.COm
REC2MID.COM
MIDIREC v1.2

I have build the midi interface, and the software I have is not really doing what I want. I would like to try some other warez. Do you have something more? I checked your Holmes utils directory and found something, but not the stuff I wrote above.

thanks,
Inspiration soft

Yes
That mail is bounced.
I found another mailadres from the same person, but that isn't replied yet,
but perhaps in the (near) future I might get that mail answered.

## 401. Bad GTIA?

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-18 15:19:24 UTC
From: llppwhite@aol.comnsp
Message-ID: <20030118101924.22397.00000112@mb-ca.aol.com>
Source record: 24014

I have a 130XE that starts shifting screen colors after it has been "on" for a half-hour or so. It does not happen when the machine is initially tturned on. This is NOT the "Attract Mode". It is a shift from the regular GR. 0 light blue screen to maybe green-blue and then perhaps to a purple-blue (randomly). If I move my Black Box around very slightly, the color pops back to the expected shade for maybe a minute or so then starts shifting again.

Any thoughts/suggestions as to what to try checking or replacing? Of course, the GTIA is soldered...

Thanks,
Larry

> Any thoughts/suggestions as to what to try checking or replacing? Of course,
> the GTIA is soldered...

The 800XL has a little trimmer that is reachable from underneath that allows
to adjust the colors with a tiny screw-driver. Maybe there's something similar
for the 130XE. It doesn't sound too unlikely that this potentiometer got bad
since it is a mechanical device.

So long,
Thomas

Try twisting the color adjustment pot back and forth to clean it off a
little. There is an input to GTIA that sets the baseline colors which comes
from this pot. They go bad a lot.

Bob

> star raiders) so would i be able to boot games from the hard disk?
Yes, you can. I have Spartados written to a 16mb partition on a 2.5 hard disk, and I just booted Star Raiders from the command line. The MyIDE interface is supposed to support loading of disk images, but I haven't tried that yet.

> Also is it any good with a 3 1/2 floppy for such?
Haven't tried it.

>Can 2 devices (floppy and Hard disk) be used at the same time.
I have my hard drive, 1050, & XF551 all connected, as drives 1,2, and 3.

>Can 3 1/2 floppies be made bootable/multidisk bootable.
Haven't tried it.

Rick

## 407. APE Warp/OS external switch positions?

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-18 20:57:01 UTC
From: john@jrcc.net
Message-ID: <de16c5ec.0301181257.67cd63d2@posting.google.com>
Source record: 24020

Hi, I recently bought an Atari 1200XL that had been modified with the
APE Warp/OS. There are 2 external toggle switches that select 1 of 4
possible operating systems.

* APE Warp+ OS
* Your standard XL/XE OS
* A public domain Atari 800 Compatible OS
* Your Standard XL/XE OS w/ Reverse BASIC Feature

Does anybody know which switch positions select which OS?

Left Right My observations
------- ------- ------------------------------------------------------------
Up Down Shipped position. Boots to a color animated Atari Logo.
I can't figure out how to get to BASIC in this mode?
Down Down BASIC comes up if I hold down the option key.
Down Up Boots to Memo Pad.
I think this is the public domain Atari 800 Compatible
OS?
Up Up BASIC comes up if I hold down the option key.

Is there any documentation on the Warp/OS? I've searched Steve
Tucker's web site and CD-ROM, the Atari 8-bit news group, and the web
and have not been able to find any.

Thanks
John (at) jrcc.net

Hmmm, I don't remember if I kept a copy of those...
Anyway, I don't remember any other MIDI software for the Atari. I once was
trying to do a MIDI-player, still have all the info I gathered on the format
of .mid files and all that, including a DOS program (for the PC) which played
MIDIs through the speaker using a single voice, source code included - if
the PC speaker could do that, why not an Atari with it's 4 voices?

## 410. MPG results

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-18 22:42:38 UTC
From: bill@newbreedsoftware.com
Message-ID: <yLkW9.61401$lk.2289329@typhoon.sonic.net>
Source record: 24023

Ok, I've used mplayer to take an MPEG video and dump hundreds of PNGs.

I then used NetPBM tools to reduce the size down to something tiny
(40 x 50 pixels; which ends up being the same size and shape as the
AVIs that are being worked on on the C=64).

I then reduce the colors down to 256, using the Atari 8-bit palette
(used Atari800's "colours.c").

THEN, I reduce the colors down to exactly 4 colors, and dump it out as a PPM.

Then when I do is load each of the PPMs, one at a time, and map the
4 RGB colors to 4 Atari 8-bit palette values (between 0 and 255),
write out the image so that the Atari can just binary-load it into memory.

Finally, along with the 40 x 50 pixels (500 bytes) to be loaded into screen
memory, I also dump out the 4 Atari color values, to be POKE'd into
(decimal) memory locations 708, 709, 710 and 712, to set the color palette
on the screen.

It's not _great_, but it's a start. (Also, it's not working exactly
right. :^) )

When I have time to work on it more, I'll post what I've got somewhere.

-bill!

## 411. Re: APE Warp/OS external switch positions?

The switch position is dependent upon how the switches were installed in
'your' case. You have to try the different positions and see what comes up.
I have one of these machines in which I added the Ape Warp+ OS. Your
switches may be installed in a different order.
The color Atari logo is 1200XL mode. One position with basic, one position
with basic reversed.
The atari memo pad screen, I believe is the 800 compatible mode.
Lastly, the Ape Warp+ OS position. Darker screen

Just now I dumped part of the Jamiroquai video "Virtual Insanity" to PNGs,
then reduced them to 16 grey shades and created a collection of 64x96 frames.

(64xY can be loaded into video memory in one fell swoop and displayed by
hardware by switching the screen to 'narrow' mode: POKE 559,33 :^) )

It seemd to work well. I think I need to rewrite the display list so
that 64x96 comes out filling the screen vertically. Right now, the video
is in the top half of the screen, and squished a bit. :^)

<snip>

Hmm... Perhaps the best way to do this is to reduce the image to 64x96
and instead of using greyscale (which isn't quite as whiz-bang),
using GRAPHICS 10 mode and a 9-color palette.

(Twice as many colors as GR.15, although half the resolution.)

And yes, I know, I know, there's APAC, ColrView and HIP modes, and even
my nifty Super-IRG mode.

The thing is, though, I think for reasonably-sized videos to be displayed,
the framerate would probably have to be pretty low, compared to what you want
the 'flicker rate' to be when using these special interlaced modes.

(And, again, there's the issue of disk or RAMdisk access messing with your
DLIs and/or VBIs)

One could, of course, render each FRAME using flicker, but then you're
doubling (or even tripling) the amount of space needed for each frame,
reducing the maximum size your video can be (to fit in reasonbly-sized
RAMdisks, for example).

Bill! Your project sounds interesting. I am happy to hear that there are Atari 8-bit users than do more than post in comp.sys.atari.8bit occasionally (like I do).

While we're at it: I have used the 9 colour mode myself while experimenting with graphics, and there is one thing that I do not understand. Why isn't it 8 or 16 colours, corresponding to 3 or 4 bits per pixel? At least 4 bits per pixel is needed to get 9 colours, and 4 bits should make it possible to display 16 colours.

My guess is that there is a colour palette look-up limitation in the hardware. Only 9 registers corresponding to shadow locations 704-712 are available.

Am I right?

Anders

I am a Swedish citizen and I would be more than happy if we
could have a building looking like Fuji logo in Stockholm.

I am not sure about New York though. Did the Fuji logo exist
before Atari Inc and does it represent something
historically?

Simply because the Atari only has 9 colors in its palette.

The 5 playfield colors, and the 4 player/missile colors.

IIRC, the 1200XL didn't have built in BASIC. It also used the non-XL
operating system standard. I could be wrong - haven't seen a real
1200XL since 87 or 88.

I thought it was a bit more tied to Japanese culture.

All this diffused through the lens of many a brew and years, so probably not even nominally accurate at this stage.

I was just old enough to catch the end of it. Back in the early 70s there was a sub culture of "Go" players that used to hang out in the Bay Area. There was the normal IBM suit and tie set of course, but there was a significant number of what can only be described as Bohemian Suits.

For instance, once I was tossing a few back at "The Alley" in Palo Alto before it became a fern bar and was introduced to a middle aged "Bohemian Suit" computer programmer. After he left it was explained to me that he would get a job and start entering data into a horse betting program he had developed. He would then have handicaps and best bet outcomes for all the currently running horses and quit his job to "bet the ponies." After another 6 months of traveling around to different race tracks his data would be out of date and he would have to get another job.

If you saw the movie "A Beautiful Mind" it was probably accurate for the time showing Nash playing Go.

Anyway, Bushnell was part of that subculture and Atari was a term used in the game Go. Not equivalent to but something like saying "Check" in chess.

From: Dean Garraghty <dgs@clara.net>
Message-ID: <1043004203.57866.0@demeter.uk.clara.net>
Source record: 24038

Hello All,

As I mentioned in a post a while ago, I have now produced a new 'budget' PC CD-ROM containing just Atari 8-bit products from Power Per Post. This is in similar style to the full price CD-ROMs I've had available since last year, with all the products in DCM and ATR format with full manuals in PDF format. This CD contains:

* Quick programming language V2.2 and V2.1 with 2 support disks
* Screen Aided Management (SAM) V1.25i 80 column desktop system (mouse or joystick control)
* SAM Budget (spreadsheet), SAM Designer (DTP package), and SAM Accessories
* Quick Ed (character set editor for mouse, joystick, or touchtablet)
* 4 games: Rubberball, Minesweeper, Glaggs It!, Bombi

This CD costs just US$9.99 including airmail shipping to any country, EXCEPT Germany, Austria, Switzerland. I cannot ship to these 3 countries because my PPP license does not cover these 3 countries.

You can pay on-line with your credit/debit card using PayPal.

Please visit my site at http://www.dgs.clara.net for more information, demos, screenshots, and to order on-line.

Dean Garraghty

Well, yes, the name 'Atari' was from the game 'Go,' of course.
(Their first pick for a name was Syzygy [*], but it was already taken.)

The logo, however, they apparently just 'made up.' :^)

PRINT PEEK(43234)

If you get 96, you have Revision B.
If you get 234, you have Revision C.

See page 212 (in Appendix 12) of Mapping the Atari, XL/XE Edition, for
details.

## 430. Visual composer for POKEY?

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-20 07:29:00 UTC
From: misterbumpy@wmconnect.com
Message-ID: <20030120022900.01965.00000201@mb-fi.wmconnect.com>
Source record: 24043

Does anyone out there know where I might be able to get a visual composition program to run on an 800XL (when I get another one, which will be soon) so I can do some basic notation in 4 voices with the POKEY chip like the SID composers on the Commodores? It doesn't have to be anything too fancy, just something to mess around with.

Any help would be greatly asppreciated!

Thanks!

Thanks for the input. Sounds like with the SG-10 it was a painless conversion during the 8-bit and into the PC days. I managed to get the printer to work from Atari Writer. Seems if we can get the computer to see am Epson it works great.

Be well,

This has got to be one of the most exciting ones. It gives full control over POKEY (filters, 16-bit, 16hz etc) for every note which no other program has allowed. Maybe not what you're looking for though, as it doesn't run on the Atari, only creates files for it to play. You do everything on the PC first. Also it is just at the Beta stage of testing. Just thought you all might be interested. POKEY and SID are a lot closer than one might imagine -check out the "like a SID" voice....why did nobody do this back in the day ??? (well, ok, maybe some demos did)

From: Dennis Brown <brownde@cs_REMOVE_.unc.edu>
Message-ID: <b0gn9e$35l@capefear.cs.unc.edu>
Source record: 23951
Cross-posted to: comp.sys.atari.8bit,rec.games.video.classic

Hi! I was a regular of rec.games.video.classic and
comp.sys.atari.8bit during 1993-1997 or so. Now I've
sold most of my stuff, but I have a few things left
and they're for auction on eBay.

Now, when I left these groups, eBay postings were
despised, which is why I didn't advertise all the
other stuff I sold. I am making one exception here
because I think the Atari 8-bits get overlooked
in general and especially on eBay.

Some stuff FA for Atari 8-bit computers:
* Bounty Bob Strikes Back cartridge
* Atari In-Store Demo Cart
* Atari XE Game System with 20 arcade carts and WICO sticks
* Light gun and 3 shooting games
* Lot of 5 B&C prototypes
* Other various lots of cartridge games
* Commodore 1702 color monitor (works great with
chroma/luma output on some 8-bits; cable not included)

Rather than posting a huge eBay URL, I've set up:

http://sale.h-body.org

Just click on the only link on the page.

Thanks for reading; I won't make any more eBay posts.

I'm installing a Warp chip into my XEGS. I've installed the socket but I need to hook up to +5VDC from the board. What is the best place to take it from?

Alternatively is it safe to power-up the Atari with no rom present so I can meter or will something go bang? I can't re-insert the original rom as I had to snip some pins to remove it (wow did they solder it in well).

Also can someone please verify the number on the MMU chip (I need to hook to that too)? Apparently it is the one directly to the right of the OS rom.

TIA, Dunx

## 444. Drive Parameters for MyDos

Newsgroup: comp.sys.atari.8bit

Message-ID: <20030120092246.18224.00000078@mb-ft.aol.com>
Source record: 23954

Whenever I boot up the CSS Ultra Speed Plus OS, I must do the following:
1) Format the D4 ramdisk to single or DD.
2) Run the USP utility that changes the ramdisk to D9:
3) Configure D4 to be an 80-track, DS, DD drive using the "O" option.

Is anyone aware of any utilities that can automate part/all of this process?
The D4 -> D9 utility cannot be run until the ramdisk is formatted. (D9 can't
be correctly formatted.)

Running a binary file to update D4 would be a big help. I'm guessing that has
been done somewhere along the way... I certainly can do it, but don't want to
spend the time if it's already been done.

Thanks,
Larry

The XL/XEs and the XEGS all have power bricks which provide +5V to the DIN-7
on the back of the units. You should be able to spot where it goes from
there.

## 448. Re: Drive Parameters for MyDos

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-20 21:50:36 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <Ma_W9.2912$Sv3.344424@newsread1.prod.itd.earthlink.net>
Source record: 23958

Atari Classics published a MyDos ramdisk formatter which could be set for
single or double density; there also may have been a data loader program to
create the binary file.

Why doesn't D9: format properly? The RB6D utility seems to do fine on my D8:

Can the D4: -> D9: process be automated without keyboard input?

If 1 & 2 can be solved, is the D4: 80 track DSDD configuration persistent
after you write Dos files and reboot with that disk?

Yep, but I was wondering whether to pinch it from the smoothing capacitors immediately after the suppressor or whether it got regulated later on, in which case I'd go for that instead.

Hi Ron-
Thanks for the ideas. I didn't remember the AC MyDos formatter -- I'll check it out. I have all the mags/disks. I'll also verify if D4 is persistent, but I'm afraid that if it is, then an automated formatter would attempt to format a DS, 80 track drive. Maybe another possibility is to make the (real) D4 into a drive >D4 and then swap it down to D4 after D4 has been moved.
Larry

But the Commodore 1084 isn't a VGA monitor... it accepts both composite and
separate chroma/luma input, which the Atari provide through their monitor jack.
All you need is one of those cables with a 5-pin DIN connector at one end and
4 RCA connectors at the other. Of course, you need to make sure you connect the
right RCA connectors to the monitor's inputs. The FAQ contains more info on
the pinout of the Atari's monitor jack.

> Thanks for the suggestions. I'll open it up this week and see if these work.
> It is irksome to see the color keep shifting!

If that doesn't work and you have a second computer, try switching power supplies. If the problem stays with the same computer, the problem is in that computer, otherwise if the power supply going bad. If a power supply is going bad, colors can shift too. If power is too low, you screen starts looking spinage green.

The MMU is the only chip (except maybe for the RAMchips) that has 20 pins. It's number starts with CO616 IIRC. You can take +5VDC from one of the smaller chips. It's usually on the highest numbered pin. (to the right of the mark/indentation)

CU Mathy van Nisselroy

PS Best Electronics catalog has the numbers for all/most Atari chips. Maybe their site can tell you the exact number.

So do I. But I can't remember the MyDOS formatter utility. Could you
please tell me where to find it?

MyRD(2) does all RB6C and USPRAM9 does and better (available from my MyDOS
page). 2 even detects whioch size your RAMdisk is at power up/cold reset.

After you told MyDOS that D4: should be 80 tracks, have you saved MyDOS to
disk to make these settings permanent?

CU Mathy van Nisselroy

## 458. Re: Drive Parameters for MyDos

Howdy folks

And you should ofcourse rename your files to:
*.AR0, *.AR1, *.AR2 etc.
so that they will run automatically.

BTW USPRAM9 changes D4: (under UltraSpeedPlus OS) to D9:
MyRD(2) changes D4: (Under US+) to the RAMdisk, whatever it's number is.
(you can set it in MyDOS)

CU Mathy van Nisselroy

My 1084 has 4 RCA points at the back, 2 audio (left and right) and 2 for video. Also a button at the front to switch from RGB to Compisite video (mind you the 1084 have several versions, Deawoo, Phillips for sure, so may not be the same as yours).

I picked up a 5 pin din plug to 4 rca jacks cable from maplins, a high street electronics dealer here in the uk (simply a regular audio cable for hi-fi's). Using a Y splitter and a Y converger as well i managed to wire it up so my 130XE displays fine (and in colour) via my 1084s (splitter on the sound so though still mono, it comes out of both speakers, converger on one of the video inputs, cleaned up the signal, dunno why, but i will not fiddle now ).

Another person tried the same but only got a monochrome display! Maybe my 130 has been modified, but when i bought it i opened it us and cleand the dust/muck out of it and did not notice any third party re-wireing, i know

there are some fun and games with the Video output over the chroma/luma output.

It was pretty much a mix and match/trial and error untill it came out right.

Oh i forgot!

there is a button at the back normaly labeled VCR, this toggles between
split and combined chroma luma. That can be important with the atari.

I finally found a good use for the ANTIC access of the expansion RAM
in an XL/XE, but now AFAIK aren'T any RAM-expansions available which
offer this, except the original 64KB of the 130XE.

Which RAM expansions offer ANTIC access?

salut,
creature

Yep, just create a display list that reloads the memory pointers on each scan
line so every 4 scanlines look at the same row of data. A very quick and
dirty way to quadruple the vertical size of pixels with no CPU code! :-)

From: David Pochron <dpoch@ticon.net>
Message-ID: <b0jvog$a1b$1@galileo.ticon.net>
Source record: 23979

Has anyone ever written a program to take a .WAV file digitized from an Atari program cassette (using whatever software and a typical PC sound card) and have that .WAV analyzed and converted to the data it represents? I suppose some sort of frequency analysis would need to be done. Probably a great task for all of the DSP's that they put on sound cards nowadays! :-)

From: Slor <slor@comcast.net>
Message-ID: <b0k0ab$qd6lk$1@ID-164868.news.dfncis.de>
Source record: 23980

At the request of people in this group, and because of my own desire to actually contribute something to the 8-bit emulation scene, I've been working on a Win32 port of Thomas Richter's Atari++ emulator for Unix. For anyone who doesn't know, this is a very nice Atari 400/800/XL/XE/5200 emulator that can be found at http://www.math.tu-berlin.de/~thor/atari++/.

I'm been successful getting things ported over and running under Win32, and I'm just about ready to offer a release for beta testing. It should be ready within the next day or so (after cleaning up a couple remaining issues) , and I could use a few people to hammer on it. If you're interested in participating, either post here or reply directly to me via email and I'll start a list. Some screenshots from my XP machine can be viewed at http://www.eslor.com/atari/screens.html.

Thanks,
James

Well, I only wanted to double it, but yeah, exactly.

I've been brushing the dust off my copy of "Mapping the Atari" lately,
so I should be able to do it pretty quickly.

(One of these days, I'll actually try running the thing on my 256K 800XL,
and not just under the 'Atari800' emulator on my Linux box. :^) )

It was by Paul Alhart in the Fall 1996 issue configuring a D4: ramdisk for a US+ OS. Interestingly, his program provided with the article violated his own good counsel concerning reading in the Percom block before changing what you need and writing it back to the controller. He reads the block to check current density status, but uses a totally separate 2nd preconfigured block for writing out the new configuration...

Paul alludes to the address of DINIT in MyDos as the same $7E0 as Atari 2.0/2.5, OSA+, DosXL, etc.; has anyone checked the source or otherwise determined that DINIT in MyDos 4.5 is also at $7E0?

Have you checked the position of DIP #1? I believe it controls the Atascii
possibilities.

Well yeah, but there's no Japanese symbol you'll find that looks like the
Atari logo. ;)

Btw, do you know how to interface zip support?

It's one thing (ok, one of a 100 & 1 things) I tried to get Tomek to
add to Plus, he didn't do it due to the size of file involved but as
any serious collectors know, size does matter :-)

Also it's easier to keep the various collections up to date with
online sets when zipped.

I think the best way would be to start out with something like a mini-itx board running a stripped down Linux as the OS and then an Atari 800 emulator.

You then modify the emulator software to provide hooks into into the hardware (upgrade the graphics capabilities, the sound, provide network access). Offer a PC2SIO interface so you can plug a 810/1050 drive into it.

Setup the emulator to offer 65816 support, and then you would have an Atari 800 capable of VGA resolutions running very, very fast.

Since this requires no hardware hacking, just software, it would probably be a lot easier, cheaper, faster than trying to build from scratch.

More info on the mini-itx form factor available here:
http://www.mini-itx.com

I dont have an ATR-8000 nor any 8inch disk drives. I am fairly certain though, from working with other systems that 8 inch disks are usually double sided, single density. I think that the standard format is 256byte sectors, 17 or 18 sectors per track and something like 80 tracks. I'm sure it can vary quite a bit.

Source record: 23991

I had a pair of 8-inch DSDD drives that I used on my ATR. They formatted
like other drives for the Atari (18 sectors per track, IIRC). They were 80
tracks per side. They could format either single or double density and single
or double sided. You could end up with 180K, 360K, or 720K. When
using CP/M you could format up to 1.4M, but I knew of no way to get
that under an Atari DOS.

Patience is a virtue... I did quite a bit of cleanup on it today, and I have one remaining issue with the keyboard that I want to correct, then it'll be all ready for you (and the others) to try out! Also, I too would like to see zip file support in there. I'm sure it can be done with the same library that everyone else uses in emulation projects, so I'll tackle that if Thomas does not plan to.

Yes, DOSINI is set to $7E0 for all the 4.5 MyDOS's. I assume DINIT
is the init vector as found on the first few bytes of the first boot
sector? Again, that's always $7E0 for MyDOS, DOSINI is loaded from
that boot sector data.

I have my suspicions that no one ever got Paul's code to do true
double density, I seem to recall that there is branch around code
in MyDOS to prevent anything other than single density formats.
There is also nothing like a real CIO call to the ramdisk in
MyDOS - reads and writes are allowed by file only, no SIO direct
sector access and formats are only done within MyDOS code proper.
Perhaps earlier MyDOSes were different than the 4.50 series?
Please do prove me wrong, I'd love to hear about it.

All Compushop compatible RAMdisks as far as I know.
And mine ofcourse. It has 1MB, separate ANTIC and CPU access and software control over BASIC, SelfTest, OS RAM/ROM and on the XEGS even Missile Command. Check out Trevor Holyoak's site for the schematics: http://www.holyoak.com/atari/8bitcomp.html and MyAtari's May 2001 issue for an artikle on it:
http://www.myatari.net/issues/may2001/memory.htm

CU Mathy van Nisselroy

PS I'm still chasing some bugs out. But most of the work should be done by now.

I have seven 8 bit computers. 5 have the original OS, 2 have the
UltraSpeedPlus OS by CSS. The only software that I have seen that is not
compatible to the US+ OS is code that does something to the screen. Not all
software that tries things on screen, but some of it will show me stuff
that's different then it should be. All in all I'ld say the US+ OS is more
then 99.9 percent compatible. I use it all the time.

So you're saying that DINIT at $7E0 is where DOSINI at $0C-D points allowing you to JSR into code that would JMP ($000C) in order to reinitialize any Dos.

BTW, I am fairly certain that Paul utilized his successfully as described. I have not used the US+ OS, but since it configures its own ramdisk sort of in hardware and transparent to Dos with DD capabilities, then direct SIO access to the "sector" data might be possible.

Source record: 23901

Hi

I have spartados 3.2g which of course doesn't run with pc xformer without the 3.3a patch. I found the patch on the internet and found it only includes the file x33a.dos. How do I patch spartados with just this 1 file? Or is there a complete image that is already patched somewhere? Any help appreciated.

:-)

## 489. CDs sent out so far, Holme's Web Site

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-22 19:29:34 UTC
From: Steve S <j70141@hotmail.com>
Message-ID: <3e2eee2f$1_3@news.teranews.com>
Source record: 23906

This is just an update on the sending out of the CDs. Some of you may have even gotten them by now. The following is a list of people that have I have sent them out to so far, if you do not see your name here, I have not received a payment and thus nothing was sent out.

For privacy, I have included only the first letter of the first name, the last letter of the last name, and the last number of the 5 digit zipcode.

So, if you are Steve Sterner (that is not my last name, so don't get excited) with a zipcode of 89170, you would be listed as "SR0".

DS - International
MN - International
KG7
BR6
RN6
RI1
CN1
KN9
JR3
RN5
FL6
BY0
PA9
ME4
TP5
JS5
JN1
JD1
CE8
DN5
BK8
WK5
DS4
DL4

The last five listed will be going out today, postage is already fixed and package is ready for sending. That is the end of the first batch that I made. Anyone sending payment after this may have to wait a little longer than the rest, as I would need to make more CDs and experience has taught me that takes some time. If you sent payment some time ago and your name is not shown here, please send me an email and I will look into it.

This list has been double-checked with ebay and paypal and the snail-mail I have received. Some people are still sending in payments and although they may have gotten a hold of me, payment has not been received if your name is

not here.

Ebay bidders, if you are waiting for feedback, I am basically waiting till the whole thing is over so I can do everyone at the same time. Please be patient. Your feedback is appreciated.

>
>
> Yep... Exactly. :)

8 colours can be coded in 3 bits. 16 colours can be coded in
4 bits. 9 colours need 4 bits.

Is it coded like this? (Pixel bit pattern and palette shadow
register).

0000 704
0001 705
0010 706
0011 707
0100 708
0101 709
0110 710
0111 711
1000 712
1001 lost
1010 lost
1011 lost
1100 lost
1101 lost
1110 lost
1111 lost

I hate it if there really are lost colours.

They should have been used for something similar
to the Amiga's extra halfbrite bit. Not looked up
in the palette, but still improving the number
of colours on display.

Anders

## 491. Warp OS Question

Newsgroup: comp.sys.atari.8bit

Just installed the Warp OS and everything started up right first time. However the Warp screen appears dark green, not dark blue as suggested in the instructions. Is this right..?

TIA, Dunx

I personally do not mind this approach, but there are people who will.
It was kind of nasty to see the Amiga community divided when Amithlon (I
think that's what its called) came out. If somebody wants to develop
such a thing though, I'd tell em to go for it!

At this point I'm happy we have some very good emulators to play with. ;)

Bill

Very funny about Santa - a mispelled for Satan. LOL

Here's an interesting note:

A Christmas Tree - which reminds me of the Holy Trinity (3-point of the
Triangle).

Back in the old days, sometime monks or brotherhoods (esp. Catholic) wore
pointed hood - like a triangle
shape - during prayers or chantings. I think it looks silly to see them
wearing really big hood like the
dutch girls of Holland.

You might noticed some old churches have a Triangle-shaped backboard of the "big" chair on the altar.

You can even see that kind of chair in "Harry Potter" film where Professor Gryfindore (spelling?
an old man with long beard) sat or stood by in the big dining room area.

Anyway, a "Triangle" is a powerful geometric reminder that the Holy Trinity exists, to the faithful.

Now where are the Atari news here?

> http://www.powow.com/oldatarian

No, not exactly, I've never heard of DINIT before. It's not a MyDOS
label that I know of, but DOSINI on the other hand always points to
$7E0 for all AtariDOS type 2 DOSes including MyDOS. I can only
assume that Paul calls the 4th and 5th byte of the boot disk DINIT
due to the fact that I don't have that article in which this DINIT
label seems to have come from. Ahah!! It's an 800 OS label which
concerns initializing the SIO routines - which wouldn't have much
to do with DOSINI or $7E0. What is it that he does with DINIT
routine? It's at $EDEA.

The 4.50 flavors of MyDOS have built in no-go routines
that thwart any attempts at double density. There's a reason, the
standard XE doesn't have a big enough ramdisk to even hold the
directory sector of a double density disk so one would need to
autosize the ram and then have two ramdisk handlers ready to
swap in and out as needed. Too much, and for what overwhelming
benifit, so SD only. Again, maybe the earlier MyDOSes would go with
it. Then perhaps Paul's routines are a total work around not
even using any MyDOS code? That might work, I wouldn't know, I've
never seen the code.

I do have an US+ and it's built in ramdisk stuff work with built in
sector copier and like stuff. So a 'handler' was required for that
part, but it's just a normal ramdisk otherwise. Execpting that you
have to re-point it away from it's built in default of being D4: to
align it with which ever number your DOS is using.

## 499. Using CX-40 joystick in Atari800WinPlus?

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-23 07:45:15 UTC
From: huggymike@aol.com
Message-ID: <20030123024515.05209.00000147@mb-ff.aol.com>
Source record: 23912

I downloaded an emulator called "Atari800WinPlus v3.1", an Atari XL/XE emulator for PC.

Is it possible to connect a classic Atari joystick, known as CX-40, to a PC's serial or USB port? Need special adapter?

How can I find that info?

If CX-40 joystick is not possible in this emulator, which other Atari 8-bit emulator will let me use the CX-40 joystick?

I was surprised to see a friend of mine had his Playstation joypad connecting to his PC running Stella (popular 2600 emu) or Genesis emulator, I forgot which one.

Mike

Howdy Mike

> 666/212 = which means "666" (satan) divided by the temp of boiling water
of Hades = Pi!! How ironic!

There is a more exact formule, something with tangent (as in sine/cosine) in
it. But I can't recall it.

> ...well almost since I don't know the exact temp of the boiling water, is
it exactly 212 or somebody round it off.

Lemme see. Overhere we say water boils at 100 degrees Celsius
(=centigrade). 100 devided by 5 equals 20. 20 times 9 equals 180. 180
plus 32 equals 212. But the exact temperature at which water boils depends
on the pressure. Higher pressure means water boils at a higher temperature
(you need more energy for a molekule to be able to escape the liquid state
it is in). Lower pressure means water boils at a lower pressure. But under
normal circumstances (most of us don't live in a pressurised house) water
boils at 100 or 212 degrees approximately.

# 506. Re: [ANNC] Atari++ for Win32 Beta

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-23 13:48:49 UTC
From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <b0ors1$nld$1@mamenchi.zrz.TU-Berlin.DE>
Source record: 23919

Hi James,

>> Btw, do you know how to interface zip support?

The question is whether I find a free (LGPL or BSD licenced) version of
a .zip uncompressor I can link against the code. Otherwise, as far as
Linux is concerned, I could simply call the "zip" program thru a pipe, but
this is not very portable.

>> Also it's easier to keep the various collections up to date with
>> online sets when zipped.

> Patience is a virtue... I did quite a bit of cleanup on it today, and I
> have one remaining issue with the keyboard that I want to correct, then

> that if Thomas does not plan to.

It sounds like a cool option, but I've to check for the possibilities.
As said, patience is a virtue. We first have to reduce the port and the
current release back to a common code basis (as otherwise James would have
to go thru all this porting mess again and again, which doesn't make much
sense if I just had to modify the sources a bit in first place).

Greetings,
Thomas

Source record: 23927

Well,
here at the university I have been taught some Budhism, Taoism and such.
Our professor was even able to write down some chinese, japanese and
korean "signs" . In all three writings there existed a symbol very
similar to the Atari Fuji logo. Alas, I forgot its meaning (it had
something to do with religion, I think and Atari is a religion of its
own, isn`t it ?!?)... -Andreas.

Yep,
Atari has something to do with Go. But the well known Fuji-logo existed
long before Atari. At least there was (is?) a chinese/japanese/korean
sign that is very similar to the fuji logo. and this sign or symbol
already existed hundreds of years before christ! Study budhism to learn
more about this symbol, that looks like the fuji-logo... -Andreas.

Well,
it is called Atari Fuji, because Atari used that symbol, and fuji,
because today (in japanese writings) it represents the mountain
fujiyama/fujiama. However in ancient times (before christ) this symbol
had a different meaning... -Andreas.

richard cortese schrieb:

Thomas, as you guessed from my initial contact re the idea of a
Windows port and the fantastic work so far I am totally pro the
emulator.

Be it 10days or 3yrs I don't mind :-)

Excuse the exhilaration of seeing the emulator becoming more
widespread, I'm just used to adding idea's to emulators like
Atari800win Plus etc as a beta person but obviously I know that things
don't just magic on themselves :-)

Emulation first, frills later :-)

Here's something even better, The Atari Basic Source Book.

Compiled by Bill Wilkinson
Optimized Systems Software,Inc.

With the assistance of
Kathleen O'Brien and Paul Laughton

You can download an HTML version of the book. Look in the
source listings for memory location $D800. The entire commented
source for the math routines is located between that address and
$DFFF. And this is from the people who developed it! Can't get
any better than that.

This link has a download link for it:
http://www.ping.be/kim-1__6502/

This next link lets you view it on-line:
http://www.ping.be/kim-1__6502/6502/absb.html

Did you mess with the POT color adjust inside the machine?

Might have to readjust it to get the right screen background.

Unless the WARP OS has it's own unique screen color...

If you adjust it, make sure your running a program or something
that you know for a fact what the screen colors should look like
(e.g. Atari DOS 2.0 or Basic with their standard blue background
and white text).

Source record: 23941

Thanks, it definitely isn't the colour pot. I've been emailing Steven and it is possible that this is due to it running on a PAL system rather than an NTSC one.

Now I just need to know why Bounty Bob Strikes Back refuses to run regardless of the rom selected.

# 529. Re: [ANNC] Atari++ for Win32 Beta

> widespread, I'm just used to adding idea's to emulators like
> Atari800win Plus etc as a beta person but obviously I know that things
> don't just magic on themselves :-)

> Emulation first, frills later :-)

Thanks for the hint concerning the zlib! I checked the licencing
conditions and found it compatible with the emulator licence. Hence, it is
likely that the next release will have .zip and .gz archive support. I'd
to clean up the disk emulation support a bit as it currently doesn't think
too much in abstract classes.

Concernig disk support: Any pointer where I could find a format description
of the DCM (sp?) archive format? It seems to be rather popular for the
Atari, and I'd like to support it.

Greetings,
Thomas

# 530. ADV: Bravo Sierra: Atari Sales, Service & Support!

Newsgroup: comp.sys.atari.8bit

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. I can afford to sell for less because I keep overhead down, I avoid going into debt and I avoid making promises I can't keep! This includes not offering services that I cant follow up with! So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New/ Good Home! So I'm involved in saving Orphaned Atari's from Atari Heaven! Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org Or goto my Domain at http://BenSells.Atari.org or Call Ben@(503)256-9974! http://www.aracnet.com/~atari/numbers.htm Calling Hours and Info:

http://www.aracnet.com/~atari/adoption.htm Atari Adoption Agency!

## 531. UltraSpeed Plus OS

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-24 09:43:36 UTC
From: Boyd <BoydStaley@attbi.com>
Message-ID: <cV7Y9.16287$VU6.17611@rwcrnsc52.ops.asp.att.net>
Source record: 23943

I have an 800XL that I now believe has the Ultraspeed Plus OS Installed in it. I have figured out how to use some options but I have not been able to find much documentation for this OS. Does anyone know where I might be able to find this information?

Thanks,

Boyd

## 532. MyDOS 4.53/4 on my site

Newsgroup: comp.sys.atari.8bit

Source record: 23797

Best Idea just get a 240/110 step down transformer, ensure 110 1 side leg is earthed, a 500W should be ab be able to run almost everyting u have. Take the output from there to 110v terminal block and plug ure American stuff in as usual. When go back home sell the 500W transformer. You should be able to get a step down transformer from electrical distributors however it will be 240/50-0-50 disconect centre earth tapping and reconnect to 1 side of the 50v

Ta da !!!!!!!!!!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

## 539. Re: UltraSpeed Plus OS

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-24 16:28:17 UTC
From: TXG <txg01@xs4all.nl>
Message-ID: <3e3169ad$0$49107$e4fe514c@news.xs4all.nl>
Source record: 23802

The Ultra Speed Plus OS

The Operating System that should be in every XL/XE computer! The Ultra Speed Plus puts unbelievable speed and convenience at your fingertips. After using it a while, you'll be spoiled! Charles Cherry in the April '89 ANTIC magazine reviewed, "Quite simply, if you don't have Ultra Speed Plus, you're using a crippled Atari."

Use any DOS to place Ultra Speed formats on your disks (with XF551 or modified 1050 drives). Now you can read and write at this speed with most programs. This high-speed mode can be turned off for maximum compatibility. Built-in RAMdisk handlers recognize any size (up to 2MB) XE-type memory upgrade. This RAM drive may be treated like a regular disk drive, capable of single or double density operation. Since the handlers are in ROM, most all programs (including sector copiers) see it. This opens up a whole new realm, as you can sector copy a disk into RAM, edit it, and even boot from it. A mini sector copier is built in for easy use.

A configuration menu is built in. This may be used to re-map disk drives to respond to different drive numbers and change the drive number of the RAMdisk.

The memory test routines have been rewritten and test all of the available memory. If a problem is found, the offending bit is displayed. The diagnostic ROM bit on the PIA is not needed so all bits are available for memory upgrade use.

Several key functions have been added: A cold start key (to allow rebooting from any lockup without losing the contents of your RAMdisk), disk I/O sound toggle, screen DMA disable (turn off the screen to increse processing time of slow programs!), internal BASIC toggle, keyboard lock, and screen color toggle. The OPTION key is reversed when booting, so you don't need to hold it to run machine language programs.

The Ultra Speed Plus module actually contains three operating systems: the Ultra Speed Plus OS, the standard XL/XE OS, and the XL Fix Plus OS. The XL Fix Plus is a 400/800 OS translator in ROM, so you won't have to boot a translator disk again! It has two modes of operation for maximum compatibility.

Four simple solder connections are required for installation if your machine has a socketed OS ROM. If the OS is not socketed, installation should be done by someone proficient in desoldering. As always, we provide free installation if you send us your computer. The Ultra Speed Plus OS is only $69.95 plus $5 shipping/handling.

Hi. I have some sealed Atari software. Best offer takes it. Willing to consider trades for classic video games, Apple II software or CEDs. Thanks for your time.

Chicken by Synapse, on floppy
Tutti Frutti by Adventure International, maybe floppy or cassette, probaly both
Us & World Geography by AEI, on floppy
An Invitation to Programming 3: sound & graphics, by Atari,2 cassettes
Home Filing Manager by Atari, on cassette
Touch Typing by Atari, on 2 cassettes
Sargon 3 by Hayden Software(also c64 compatible), on floppy/floppies

River Rescue by Thron EMI, on cart for VIC-20, unsealed but complete
Robotron:2084 by Atarisoft, on cart for VIC-20
TI Invaders by Texas Instruments for TI-99, on cart, unsealed but complete
Robbeary by Anco, on floppy for Amiga

Hope to be trading with you soon. Email to MrMego@aol.com

Mark

Source record: 23807

Normally one would use the BOOT X33A.DOS command with your system using some other compatible version of X3nx.DOS which you cannot do since XFormer will not boot with them...

Does the BOOT command place the actual Dos sector locations in the boot record? Or does it just note the file name?

You might hope for the latter and rename x33a.dos to x32g.dos on your boot diskette. Another possibility is to copy x33a.dos to the name x32g.dos such that it overwrites into the same sectors.

Failing that, study up on Sparta structure and use a sector editor to configure the boot record to what is required.

Micro Illustrator Koala Technologies Corporation
Astrology Atari Program Exchange APX-20078
Success With Math CBS Software(3 disks)
Addition & Subtraction
Multiplication & Division
Linear Equations

The computer, disk drive and printer are in excellent condition and are all working. The cartridges and programs have not been used for some time, but appear to be OK. The other accessories have not been checked, but I believe they are also OK. Most items are complete with their instructions or manuals.

Asking $225.00 plus shipping for the complete system. I prefer to sell everything together, but will consider reasonable offers for individual items. The system is located in Northern Virginia area (outside Washington DC).

e-mail: crossnet@ix.netcom.com

## 552. Super Pac Man prototype question

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-25 02:34:29 UTC
From: satcom2@attbi.com
Message-ID: <82a18ff2.0301241834.2cb7183b@posting.google.com>
Source record: 23815

I think I have an actual Super Pac Man prototype for Atari 8-bit computers, but I am not 100% sure. Back in '86 or '87 I went to San Jose Computer, a popular Atari dealer at the time, and bought some games. Before I left, the owner (I think he was the owner, totally forgot his name) went into the back room and came out with a shoebox. He pulled a cartridge out and told me it was an actual cartridge he got direct from Atari. He sold it to me for $8. (I don't think the retro game collecting craze had hit too hard yet 16-17 years ago).

I shopped there at least 3 or 4 more times from the late 80's to early 90's. He never had any more that as far as I could tell, so I doubt that he made the thing himself.

Years later, in 1997, I was a bit annoyed when all the newly made copies started going around, thinking that my game was worth much less now. But it became clear after a few years of seeing various protos on Ebay, as well as talking to some people at CGE 2002, that maybe this was probably something pretty rare still.

I finally opened the case with a screwdriver to look inside last night, and sure enough, 2 EPROMS, uncovered ones even! (eek...) Right under a *really* bright bulb, as I stared for a few seconds. I was kind of paranoid that I zapped it with too much light (which I have heard can erase an Eprom), and had to rummage around looking for all my Atari 8-bit gear to hook up and test it. It tested just fine luckily, through plenty of levels.

I didn't read anything that made sense to me on the chips, but it was an Atari board. I found a picture of a prototype of Last Starfighter on the web, and the sticker label looked identical in size and shape to my Super Pac Man label, including having one label over another in exactly the same fashion.

The label on mine has the computer printed text "Super Pac Man Cartridge 01-19-84"

The game is very complete, I have played it through the years many times, to very high levels.

Anyone have an idea of how valuable this might be, or how many of the real ones exist? I am tempted to either trade it, sell it on Ebay, or perhaps keep it in the video game community and auction or trade it at CGE 2003. (I am not into protos really at all, I would be happy with a 1997 reprint of it just to play)

If anyone else out there has one of these or has seen one I would like to hear about it. I would especially like to know what text to look

for on the chips.

-SaTcom2

I don't think anyone cares if it's an original prototype. In my own opinion,
a copy of a cart is just as good and I won't pay any more. It's not that
important to me.

Message-ID: <SpnY9.1512$d66.159113@newsread1.prod.itd.earthlink.net>
Source record: 23817

ok that worked...

In my case, I had to boot my original atari 130xe (connected to pc w/ sio2pc cable) and boot the image of 32g. copy x33a.dos to the image, and run the BOOT X33A.DOS command. Then I copied that disk image to my pc running xformer and it boots fine now. I wonder how someone WITHOUT a real atari handy would do this(?) since they will not be able to boot any of the latest spartados versions to copy the x33a.dos and run the boot command(?) Oh well...

Thanks to everyone who responded!

I think I need to clarify my original post.

Please note that the price is for EVERYTHING, including the computer,
color monitor, disk drive, printer plus all the accessories and software
listed.

I will also consider any reasonable offers for the individual items.

thanks

em

Source record: 23822

Solar Influx wrote:

> cant wait

Current status:

* ZP Variables now relative to a start address
* seperated (hopfully) all LISP Vars from Oric Vars
* disabled the filesystem code (will work on that later)
* inserted ATARI Routines for reading keyboard / writing to screen

The LISP Port assembles without error and produces a 6K binary. I can load the binary and can type text, although I only get rubbish back :))

Next step is to debug and to get me familar with the inner LISP workings. I will order the LiSP Book (LISP in Small Pieces) for that (very expensive book, hope it is beeing worth that money).

Stay tuned!

Carsten

## 560. FA: HOT SLOTS for NES

I bought one, but have not gotten it too work completely yetin external config..I guess I am still looking for a 100% compatible hard drive. The MyIde software works, but accessing a partition in Mydos gives me a 160 or 130 error.

You can create boot images..but you have to have the software/hardware to copy cartridges to disk, and copy commercial protected floppies to a new disk(without requiring the hardware to be present to run). Either should use an available hard disk image.

MyIde has nothing to do with 3 1/2" floppies. These attach to the SIO or parallel port and work through DOS as any drive, if the DOS supports the size. The only norte here is that MyIDE and the Blackbox share some memory, so 3 1/2" drives attached to the BB will (probably) not work. In general, yes they can be bootable.

>
> Anyone know for sure?

8" drives under Mydos formatted to single or double density, single or double sided, 77 tracks per side, 26 sectors/track, for 500K or 1 meg per disk max. The 26 sectors per track is what makes a 1050 disks look like a small 8" disk to Mydos. The 77 tracks per side is what limits 1.2meg 5 1/4" disks(looks like another 8" disk). 80 tracks are availbe for 5 1/4" and 3 1/2" disks in 9 or 18 sector/track mode. Yes, it was made a bit complicated.

High density is 512 bytes per sector standard, but CDs and other can do 1024 or 2048 bytes/sector.

If its a graphical problem then maybe ++ will as it uses a different
graphics system. Hence Master of the lamps works on ++ and not on
Plus..

Hey Thomas, all these pluses and ++ are confusing ;-)

kvan

## 569. Re: spartados 3.2g + 3.3a patch...how do i do it?

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-26 07:24:19 UTC
From: Marius Diepenhorst <grover25@zonnet.nl>
Message-ID: <b102g3$l0r$1@reader08.wxs.nl>
Source record: 23832

SpartaDos 3.3a is as far as I know, the only spartados version without HighSpeed SIO routines. These highspeed routines are the reason why all other version doesn't work with xformer. Xformer is not really a smart emulator. In fact is an high-speed sio routine a modification of the OS (a small one). Xformer has it's OWN way to do the sio. Other software with modified sio-routines won't run neither on the xformer.

How to do it without a real atari? Simple: just use the atari800 emulator, or the atari800 emulator for windows.

You will see these emulators do run the other versions of spartados too. You'll discover sparta 3.3a is still the best to use, because the atari800 emulators are using their OWN sioroutine too (a VERY fast one!), but when your dos (like spartados 3.2g) has its own sioroutine, the fast sioroutine of atari800 is switched off and the high-speed routine of spartados is used... but that one is really slow in stead of the highspeed of atari800. So even in that emulator you better use sparta 3.3a

IMO: the atari800 emulator ( I use the windows version) is MUCH MUCH MUCH (!!!!!!!!!) better; xformer has bad sound emulation, and runs only programms that are programmed the 'right' way. All tricks (like in good games, and demos) are not emulated very well by xformer.

My advice: just keep using your REAL equipment.

What about Manuel's interface (the guy from Belgium)? I still use it, and
still LOVE it!! It has the advantage that you can use 2 sticks, and it
works like a "normal" PC stick (ie. works with other PC games).

Who remembers Manuel's full name and website address? If nobody remembers,
I will look it up at home...

Sorry for being lazy :-)

Richard

Hi Ron-
> Larry, did you ever determine why your initialization of D9: ramdisk is not reliable? Are you using MyDos 4.53 which reportedly has the Axlon bug repaired and a version of RamBoot up near 6? <

No, I use 4.50. I've used 4.53 before, but I've always gone back to 4.50 as my mainstay. *I think* more of my stuff works with 4.50, but I'd be had pressed to support that assertion. I norrmally use a 320K XE with the USP OS. I'll have to try some additional combinations with other hardware variants. Thanks for the tip. I've created a text file for this thread, so I can easily find the suggestions -- I'll add this to it.
(It's a little off the subject, but I think of all of the hardware, OS, and software combinations that we have for our "simple machines" -- and then I think of the issues facing Microsoft, et.al. and 3rd party developers trying to provide a platform where everything works with everything else. Whoa! My head starts spinning...)

This would be Emmanuel Fernandes, and a great joystick enhancment for PC's
and emulation. All my PC games will use my Atari joysticks, and emulators
with Mame I have been able to increase nearly all my hiscores. Iam not sure
about his Web address or email.

Hello there txg, hows the atari going, keep the faith, keep atari hummy

Anyway, I had a previous version of this u/g as no one in the UK would take on this u/g ie gralin, software express, blitterchips, sillica etc etc.. shame

The version I had only supported modified 1050's and stn'd xf's and none of the added embellishments of us speed os +, my version was called warp speed o/s

I never got around to testing it with a super speedy 1050 (euro' version of the lazer/usd or happy u'g- lazer or hyperdrive were famous UK hacks/clones of the more famous happy 1050u/g- I have the ST version of tyhe happy 1050 u/g)

happy atari'ng

> Larry

The same things you use any other high level language for. A Lisp implementation doesn't have to be slow and/or memory intensive. To fit on something like a A8 yet offer reasonable performance, the implementation will probably have to include a compiler and a carefully selected subset of whatever Lisp dialect the author chooses.

If the implementation was fancy enough to implement something akin to a vm paging system off some local storage, then the language could host much larger programs and some of Lisp's real potential could be displayed.

The team at AtariArchives.org is proud to announce that the full text of the classic book _Electronic Computer Projects For Commodore and Atari Personal Computers_, by Soori Sivakumaran, is online at http://www.atariarchives.org/ecp/

Published in 1986 by Compute! Publications, this little-known book includes schematics and software for projects to turn your 8-bit Atari, Commodore 64, or Vic-20 into a burglar alarm, robotic motor control system, and digital light sensor. Other projects show how to build a joystick, paddles, light pen, and logic probe for your computer.

The site includes the complete program code and text from the book, with permission from the publisher. This is the 10th classic computing book to be made available at AtariArchives.org.

Message-ID: <20030128050149.17286.00000477@mb-bd.aol.com>
Source record: 23864

Found the source of my troubles (I think). When I switched my Atari emulator at work to NTSC mode, all my versions of Bounty Bob Strikes Back crashed on loading. I've found an ATR of an NTSC compatible version and I'll try that tonight. It appears that the Warp OS (and the other three included) are all NTSC where as my machine was PAL.

Is there any other ramifications of using an NTSC OS on PAL hardware?

Tia, Dunx

Basic is not integrated at all into the os- in contrast to at least
the Apple micros. The fp, screen (and graphics IO) are all supplied
by the OS. DOS is also independent of Basic, though Basic supplies
some high level functions that can exploit it if present. The
tokenizer (by which I assume you mean the Basic tokenizer) is supplied
by Basic. On the other hand, the high level sound operations are
supplied by Basic, though they end up manipulating the hardware sound
themselves.

Message-ID: <%8BZ9.744$wd2.64830@newsread2.prod.itd.earthlink.net>
Source record: 23875

It turns out that Sparta is similar to 2.0 in maintaining a pointer to the actual sector for the Dos file in the boot record... So, you must boot with a Sparta compatible file management system and copy the new Dos to the image, locate the proper directory and file entry for it and then put the number of the 1st sector map in offset 9-10 of sector 1.

## 613. Help with VBI

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-28 20:42:31 UTC
From: Mopar Man <nospam@nowhere.com>
Message-ID: <8eqd3vg1ra7if5t9huncj815s14df7ec6c@4ax.com>
Source record: 23876

I was trying to implement a color cycling routine in the deferred VBI,
but it kept crashing. So I removed all that code and just had my
deferred VBI routine jump directly to the Atari's deferred VBI. The
machine still crashes.

Here's a disassembly of page 6.

```
0600 LDY #$20 ; 2cyc ; A0 20
0602 LDX #$06 ; 2cyc ; A2 06
0604 LDA #$07 ; 2cyc ; A9 07
0606 JSR $E45C ;SETVBV ; 6cyc ; 20 5C
0609 RTS ; 6cyc ; 60
0620 JMP $E462 ;XITVBV ; 3cyc ; 4C 62 E4
```

600 and 602 tell the Atari that my VBI routine will begin at loaction
$0620
604 tells the Atari to use the deferred VBI
606 sets the vector
609 VBI relocation complete
620 simply return control to the normal deferred vector

Now, this shouldn't do anything at all. Using Atari800 Win 3.1
however, calling the routine via the BASIC statement ? usr(1536)
crashes the machine. Any ideas as to what I am doing wrong?

Thanks a bunch for any info.

Stephen Anderson

I don't remember all the VBI setting stuff, but you *have* to put in a PLA
in there to clear the stack when you call a routine from basic.

The first byte on the stack is the number of arguments which in this case
will be zero.

Message-ID: <b189je$dki$1@mamenchi.zrz.TU-Berlin.DE>
Source record: 23880

Hi,

> Is there any way to get the emulator to use a graphics mode (through SDL, I
> assume, since X11 isn't fullscreen) that uses a custom modeline?

It's a matter of SDL to figure a fitting modeline out. The emulator
requests something like a 352x240 pixel display, depending on your settings.

> The aspect
> ratio of a standard PC mode isn't right, since it uses square pixels and the
> Atari pixels aren't square.

Well, if the modeline that SDL chose for emulation isn't square, you can
help it a little bit: Press F1 to go to the menu, scroll down the left-hand
sided menu and pick the SDL_Frontend button. Then, on the right hand side,
you'll see two scrollers that say "PixelHeight" and "PixelWidth". You might
have to scroll down a little bit to see them fully. Then, adjust the
controls until you get a usable aspect ratio. Another good idea is to
drop some pixels at the right or top edge of the display, again with
the settings at the same control page.

I personally setup a mode line for a 360x480 display, and use a pixel
height of two, a pixel width of one, all other settings at default. This
gives a nice full-screen image, as from a real Atari. Well, except that
the image is crispier due to the better resolution of the monitor. (-;

Greetings,
Thomas

For sale:

SWP ATR8000 Interface System
64k Ram onboard
High speed Serial Interface
Parallel Interface with buffer
Floppy Drive Interface (use 3.5, 5.25, 8" drives in any combination)
CP/M 2.2 Compatible
Co-Power-88 Option w/128k Installed for IBM PC Compatibility

Includes manuals, mydos, CP/M and MS-DOS diskettes, and untilities.

$300

CSS Black Box Inteface
PBI/ECI Interface for XL/XE Systems with PBI or ECI interfaces
Serial port
Parallel port
SASI/SCSI Hard Drive Port
Expansion header for Floppy board controller (still sold by CSS)
Built in utilities, screen capture
Manual and Utilities Disk included

$125

Available for direct sale until the weekend, if no one buys them they go onto ebay.

Curt

## 628. Pokey chips source?

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-29 21:59:26 UTC
From: David Pochron <dpoch@ticon.net>
Message-ID: <b19is1$hol$1@galileo.ticon.net>
Source record: 23891

Anyone know of a source where I could pick up a spare Pokey chip or two for an Atari 800? After I reported my Indus drive was dead a few months back I did some more investigating and found that not only is the drive dead but the data out line of the Pokey chip (pin 28) constantly stays low when data output is attempted! So whatever zapped the drive made its way back along the serial port as well. :-(

The irony is, when my Atari 800 died back in 1988, it turned out to be the 6502 but because I didn't know what went bad I picked up a pair of CPU boards so now I have 3 sets of all the custom chips - except for Pokey which is on the motherboard! :-(

Mmm, brilliant level of modularity for its time, I'd say!

Perhaps someone could documentize "porting a PL to the A8 FAQ", and
who knows, it might actually catch on ;).

## 632. Rambling Russg rambles.

Newsgroup: comp.sys.atari.8bit
Date: 2003-01-30 05:39:48 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <v3hektp8ccq60@corp.supernews.com>
Source record: 23895

I saw a link to zip source code someone posted here.
That link was for what used to be infozip and is now
called zlib. Jean-Loupe Gaille and Mark somebody
wrote the software.
There was a link to JLGs site. There was then
a link to one of his interests, Japanese/Oriental game
of Go. I remember Atari comes from this game, but
didn't know exactly what it referred to in the game.
Followed more links and got to a beginner's tutorial
on the game.
Go is a game where you try to surround your opponents
'stones' (white ones and black ones) and sorta capture
as much of the board as possible.
An opponent's stone that is all but one stone surrounded
is called in 'Atari', about to be captured. Two stones
almost encircled is a 'double atari'.
New subject.
I've been working on a game, using XLIT and A800win.
I don't believe it has ever been done on the A8.
It's called 'Skunk', a two dice game.
I have some of the graphics and program logic done.
Have a lot more to go on it, but I can play it at this
point.
Intend to put some text in memory, the word
'Skunked' and 'Double' as a graphics object, taking
up about 8 lines of my graphics 7 screen, then poke
a LMS load memory scan, into the DL to bring up
the graphic.
But I ramble.
I expect it'll take months to get it right. I'm not using
Action or assembler (I have one ml routing so far to
do some bit twiddling, on page 6.)
Jindroush's post about ABC compiler version 1.02
working on A800 was how I found out to get ABC
to work on A800. It has to be compiled, it is really
slow, even in XLIT with my fairly fast PC.
Rambling Russg

Is there anyone out there who knows where I can find Bank Street Writer for use on an 800XL w/XF-551?

I seem to remember it being a nice and simple word processor for its time and thought that it'd be neat to have and to introduce my kids to.

Thanks!

> so it glitched. I could no longer move my ship, and the two enemies were just
> constantly moving from side to side.

Not necessarely an emulator problem. You did use it with the XL Rom, I suppose?
Now, Bacterion has a problem: It uses a PMBase of zero, meaning the missiles
will end up in page three. Unfortunately, the Os VBI monitors the CartCtrl
shadow register at (IIRC) 0x3fa. If this changes its value to something
different than GTIA Trig3, the Os "hicks up" and blocks all further activity
because "it thinks" that a cart has been inserted. This means specifically that
Bacterion does the very same thing on a real Atari XL. I personally fixed this
problem on my edition of Bacterion simply by poking TRIG3 back into the
shadow register in the immediate VBI, but if you want to play the original
unmodified, you'd had to use the Os revisions A or B, but not the XL version.

Greetings,
Thomas

It is absurd how it hasn't occurred yet to some that perhaps the reason for the lack of business is a largely angry customer base that doesn't want to do business with him. *sigh*. He's digging his own grave.

Hey all, I have a Jam!!, and over the course of a couple moves have misplaced the video cable. It's the single cable with the svideo on one end that plugs into the device, and has the rca female connector, which you plug the video out from the Atari into. Does anyone have one that they could provide me the pinout with a ohmmeter? Since I can't find one, and can't seem to find AimsLab on the net anymore, I was hoping someone around might have one handy.
Thanks,
Isaac

I have a note that BSW does not run on an XF 551 -- presumably the copy protection didn't like something the XF system responded with. Of course, BSW was a popular program in its day, and there may have been more than one version. But if you decide to buy one from an Atari supplier, you might see if they will test it for you before you shell out cash.

I don't think so... I actually had the pleasure to buy from him right
before christmas, partly because of his posts to this NG but also because
of yours and others unfair complaints about his ads here.

Got a couple of hard to find items and yes, his service is excellent!
Some might think twice before sending cash in advance to remote
continents but with Ben Smith there is no need to worry. Just remember to
use insured mail when sending money.

He kept his promise about "quick turn around time" and I got the items
here as fast as the postal system permits by "Global Priority Mail" at no
extra cost.

So the fact he has updated his catalogue is certainly good _news_!

The game of "Go" was the first program I ran on a digital computer sometime back in the 60's. I made it from a kit when I was a kid. It was a non-electronic computer, with springs, levers, and plastic posts on which to insert plastic sleaves in the form of short tubes which made up the "program". Each computational cycle was generated by pulling and pushing a plastic lever. It had a three-bit output. The posts and tubes were a rough analogy to toggle switches. I wish I still had that thing.

Hi Paul, hi Ken,

>>Yes, I used the XL ROM. (What's scary is that I still understood your
>>explanation...)

> You did, I thought he was making it up ;-)

Well, we can of course find it out precisely: Play it again, and bring it
into the "locked out" state. Then go to the menu with the F1 key, and
go to the topmost "prefs" menu item. On the right hand side, you'll find
amongst others two "string gadgets" saying "Save configuration" and
"Save state". The first places the emulator setup in a file. Please do that
(e.g. save the configuration as "bakterion.config" by entering this
name into the configuration saver gadget and press return), and also save the
machine state as "bakterion.state". This second file contains the complete
machine state at the time you made the snapshot: All hardware registers,
the complete RAM contents, etc..., allowing me to continue the
game play (or rather the crash, in your case) from this point on.

Both files will end up as huge text files you could simply forward to me. Then,
I can load them here into my emulator as well and would be able to see whether
my hypothesis is correct.

Greetings,
Thomas

In that case may I recomend Mini Office II. Word processor, Database,
Spreadsheet + Charts and Comms program. Available for most machines that
were available in the UK. Think of it as a microsoft works of its day. It
was a MONSTER hit here when it came out. About all it was missing was a Desk
Top Publisher. Certainly sounds closest to what your after.

I definately think its a worthwhile project. I know there used to be interlisp for the atari 8's but it was commercial (I think) and I've not seen it available for years. Would be good to collect some source code together for people to use as examples as well.

## 666. Zaxxon Cassette

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-01 06:07:09 UTC
From: Ron Pothier <cowboy.ron@verizon.net>
Message-ID: <huJ_9.2137$uq1.875@nwrddc03.gnilink.net>
Source record: 23679

This may seem like a dumb question, but I have an old Zaxxon cassette and I just bought a 600xl computer with a 1010 program recorder and I can't get it to load and run on this computer. I hold down start and option to load and hit return when the buzzer sounds, but I keep getting the test screen after a few minutes and the game never shows on screen. What am I doing wrong? I thought holding down option would disable the basic. Is there something else I need to do? It's been over 10 years since we have had any Atari computers in the house, just some old software cassettes that we would like to play. Any help would be appreciated.

Thanks,

Cowboy Ron

> ... but I keep getting the test screen after a few
> minutes and the game never shows on screen. What am
> doing wrong? I thought holding down option would
> disable the basic. Is there something else I need to
> do? ...

Holding down the option button does disable BASIC,
increasing the amount of available RAM memory.

Also, the original memory configuration of the Atari
600XL computer is 16 KB of RAM, which means only the
16 KB version of Datasoft's Zaxxon can be played on it,
not the 32 KB version. If the computer has been
expanded to 64 KB of RAM, all games work. If your
Zaxxon game is intended for 32 KB systems, check the
amount of available memory with the BASIC command
PRINT FRE(0), I think it returns 37902 on 64 KB
computers.

More likely: It sounds as if there is a problem with
the tape or possibly with the cassette recorder. When
the Atari computer enters the self test mode or hangs
during a tape load session, it is an indication on
that there was a load error, a load failure. If you
listen to the loading sound, you can normally hear
that the sound changes a bit right before the load
failure.

From what I can recall, the Zaxxon game is not one
long single load file, but a loader program that
takes over load control 40-60 seconds after you
have started loading. A sign of this is that the
screen changes and displays "Zaxxon" with white
ASCII graphics on a dark blue background. Does this
happen?

Anders

Thanks... I found an Atari disk image FAQ right after I posted the message!

Is there any special way to format 360K DSDD disks on an 800XL with an XF551?

I don't know yet because I don't have any software to run on it and am
currently without APE or anything useful like that.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I have another "flakey" 1050, so I was rumaging around in the csa8 archives at Google, and ran across a post by Ben Poehland.

> ... I'm palanning a "Secrets of the 1050" article in the Jan-Feb issue of Current Notes, in my "Alchemist" column. <

This would have been J/F of 1992. I have a lot of CN mags/articles, but I don't have that one. Does anyone know if it actually happened?

(also) IIRC, ownership of CN was transferred to someone in Canada (?) Whatever happened to it? I was thinking that the new owner was going to have an all-ST mag, but it never really got off the ground? (I'm really fuzzy about this one -- maybe another double-expresso will help :-)

Larry

Also try to rewind the tape completely, zero the counter and fast forward
two or three, then do the same as you do. Depends on how soon the test
screen appears. There's a poke 54018,52 (or something, need to check) to
start the tape recorder, so you can press play and listen to the sound on
the tape. If it's very low, you might need to tune the recorder.

Good luck

Uh, why don't you just load the .ATR files into an emulator and copy/move
the files there?

## 676. Surge Protectors/Ground

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-01 22:20:19 UTC
From: llppwhite@aol.comnsp
Message-ID: <20030201172019.08416.00000396@mb-fu.aol.com>
Source record: 23689

I have a surge protector at virtually every outlet in our house -- certainly protecting my Atari (ok, the PC, too!) The "best" that I have found are from ACE hardware -- about 1500 Joules + RFI filtering + modem protection for about $16.

Most of the better protectors have a "Ground" LED that flickers sometimes, and sometimes shows nothing. Can anyone explain what the ground LED shows?

I'm also considering purchasing a good (power) line conditioner, maybe with an included uninterruptable power supply. What kind of experiences has anyone had with these? Good investment for computer use?
Thanks,
Larry

To remove IC's it is possible to do it with desoldering wick as well. To do it proberly and have the IC undamage (and traces as well) you must be quick, and having good lighting and a maginfying glass will be handy. Also I didnt figure this out until 3 years ago, go to an electronics store (radio shack wont have this stuff) and get some liquid flux and a dispenser bottle with a fine nozzle (the nozzle looks like one from a medical syringe).and put a drop of it on the pin you want to desolder just before you apply the wick and iron (or the desoldering bulb if you've got that) quickly touch the iron to the pin, should be on for less than a second to do it proberly and minimize the chance of damage. If you do use the wick it should go on the pin to be desoldered and the soldering iron to apply heat.

Btw, desoldering stations are probably the easiest but are very expensive, you can spend $1000 or more on one of those.

>>my hypothesis is correct.
>>
>>Greetings,
>> Thomas

> You see those smiley things -> ;-)

> That's the joke one I used :-)

> I never doubted your explanation for a sec :-)

Well, Paul, I did indeed. (-; But I was serious as well: In case you think something's nasty going on in the internals of the emulator - or the emulated program - please send me the snapshot file and the configuration. This definitely helps me to figure out problems should there be some.

Greetings,
Thomas

P.S.: The 1.16 is now nearly done. It'll contain support for .DCM, and for .gz'ed images of all formats.

Imageman.
It'll work for extracting and adding files to DOS 2/2.5/MyDOS, but single
density only I think.
Bo Schreur's XDIR is good for Sparta disks, double
density and 16 meg. I think only an extractor, you
can't add.
Imageman can be obtained.....
ftp.spudster.org in the emulators/transfer utilities folder.

Obviously, because that wasn't what I wanted to do - but thanks for the
useless reply anyway. Now, if anyone REALLY cares why that's not what I
wanted to do... I'd like to be able to manipulate a whole slew of images
quickly and without having to re-mount and reboot the emulated (or actual)
machine every 2 minutes.

Tom: I still have mine. Name is "DIGI-COMP 1"
"First real operating digital computer in plastic" Red & white plastic,
rods, manual "clock", ....
(Ran at a speedy 1.5 Hz - 1 billionth of current clock speeds!!)

Complete with Instruction Manual (dated 1963), parts list/assembly instr.,
tubes, labels, etc.
The only part that did not survive was the rubber bands, and they're a
special
size not easily replaced (I tried a few years back).
Mfg. was E.S.R., Inc. of Orange NJ

(my 2nd computer was my Atari 400 - currently have 7 diff computers in
various states of repair.)

I've been considering putting up my own collection for awhile now.

I run a server for my business and could host a fairly sizeable
collection if the bandwidth demands aren't likely to be extreme.

Let me know if you're interested.

Yeah, I have the Tom Mix software version for my TRS-80 Coco. I was real disturbed about what happened this morning and my heart goes out to the families, but it reminded me of Compuserve way back in 1981 or 82. I remember a Columbia space shuttle liftoff simulator that you could download. Essentially what it did was print out line by line each step of the shuttle liftoff. It was very accurate and detailed. I was wondering if anyone ever saved that and still has a copy?

i think creative computing had something like that. maybe we're talking the same thing (creative computing version & not the activision version). it might i've come from their magazines or one of their 2 big books (one yellow one red).

i found a site not too long ago that somone had posted (for the IBM PC) of every creative computing basic program ever published. if i find it i'll post the link.

## 700. A8 Game "Kaiser II" released as free software

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-02 16:35:15 UTC
From: Carsten Strotmann <cas_news@strotmann.de>
Message-ID: <b1jh3v$13l5c5$1@ID-174234.news.dfncis.de>
Source record: 23764

Hello,

today I've released the game "Kaiser II" as free software (GNU Public License). The game sold approx. 600 copies between 1990 and 1992 in germany.

Kaiser II is a stratiegic game for up to 4 players where your a medieval sovereign on the way to become the Emperor of the world.

It has some nice hi-res graphics done by Bjoern Israel, some digi-sound and a long lasting gameplay.

On the webpage you can find the versions for 64Kb, 128Kb and 320Kb ATARI, as well as all Turbo-Basic Sourcecode, two Disks with the Source and all Pictures/Music/Resources and a Demo for the SAG Fair in 's Hertogenbosch back in 1989.

The gameplay is all in german language, but now that the sources are free and it's mostly turbo-basic, it should not difficult to translate the game to an other languages.

Please contact me if you're interested in doing a new localized version.

Website
http://www.strotmann.de/twiki/bin/view/APG/GameKaiserZwo

Have fun!

Ciao

Carsten

## 701. Re: Surge Protectors/Ground

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-02 16:54:29 UTC
From: w_tom <w_tom1@hotmail.com>
Message-ID: <3E3D4D45.259A56FD@hotmail.com>
Source record: 23758

The LED reports when the safety ground is disconnected.
However it does not report when a safety ground is good.

Those plug-in surge protectors are only as good as their
earth ground - which is not same as safety ground. That LED
is completely unaffected by earth ground. Plug-in surge
protectors are typically so distant as to have all but no
earth ground connection. No earth ground means no effective
surge protection.

Effective 'whole house' surge protectors costs about $1 per
protected appliance. You have spent $16 per appliance for
protection typically from surges that do not exist. 'Whole
house' surge protectors are for the destructive common mode
surges due to a critical 'less than 10 foot' connection to
central earth ground.

Surge protectors are not surge protection. Surge protection
is earth ground. A surge protector is only effective when it
makes a short (temporary) connection to earth ground. Plug-in
surge protectors don't even claim to accomplish this since
discussing earth ground may result in embarrassing questions.
Therefore they avoid all mention of earthing and have no
dedicated earthing connection.

Even worse, an adjacent surge protector can even result in
damage to the powered off computer. A surge protector is only
as effective as its earth ground - which must not be confused
with safety ground.

Power conditioner does noting productive for computer.
Computers already have power supplies so resilient that they
even withstand the 'dirtiest' of AC power. A plug-in UPS in
battery backup mode can output some of the dirtiest power
experienced by a computer.

A plug-in UPS is only for data protection. It does not
provide hardware protection.

Hi,

Thanx, I will check the files later this week.

Sorry that I didn't notice it before but there are at this point so many files. But I will do a check on all of them...

When someone has the working files please upload them so I can replace them on the FTP server...

## 703. Holmes CDs with tens of thousands of Atari Games

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-02 22:08:32 UTC
From: Steve S <j70141@hotmail.com>
Message-ID: <3e3d938d$1_7@news.teranews.com>
Source record: 23766

I want to thank everyone that purchased these CDs. It has made me rich beyond my wildest dreams. Even now, I am contemplating the purchase of my fourth summer home on the beaches of a nice tropical island in the Caribbean.

All CDs have gone out now, last one went out last night (which means the mailman will pick it up on Monday morning).

If you do not receive your CDs in a week or two, let me know.

To receive your own copy of the CDs, send payment of $15 through www.paypal.com to j70141@hotmail.com

# 705. Re: PC manipulation of .ATR files

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-03 00:05:00 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <Mmi%9.4908$ek4.443455@newsread2.prod.itd.earthlink.net>
Source record: 23768

Go to Ken Siders page and get his ATRutility v 1.3 or so.
http://home.columbus.rr.com/ksiders/atari.htm

It is a Windows app and the best I have used for what I understand that you want; it adds or extracts with atascii <-> ascii translation options and much more. Only caveat I found is DD images created with it are missing the last two (719-720) sectors..?

In case people missed this pass by on Slashdot:

A Commodore 64 For The New Millenium
http://slashdot.org/article.pl?sid=03/02/01/2035204&mode=nocomment

The CommodoreOne is now available for purchase. The C=1 is a reimplementation
of the Commodore=64 in an ATX form factor, 65c816 processor running at
approximately 20 MHz, VGA out, an updated SID (with backward compatibility),
32 MB of RAM, standard IDE, PS/2 ports, and a 64 compatible cartridge slot.
Let the hobbying begin.

More info on the CommodoreOne:
http://c64upgra.de/c-one/

A place to purchase it:
http://www.kdh-shop24.de/catalog/default.php

So, is anyone gonna work on the "Atari 2003 XE"? ;^)

-bill!

<Sf1%9.29262$HG.5461186@news4.srv.hcvlny.cv.net>:

>DIGI-COMP 1

That's the one! Thanks. I bought it through Edmund's Scientific
catalog (which was my "dream book"). 1963-1966. I wasn't even 10 years
old at the time. I found the following information about it:

United States Patent No. 3,273,794.

http://groups.google.com/groups?q=alt.folklore.computers+%22digi-
comp+1%22&ie=UTF-8&oe=UTF-8&hl=en

http://www.alltheweb.com/search?cat=web&cs=utf-8&q=%22DIGI-
COMP+1%22&_sb_lang=en

Now I want to either find one on ebay, or make one. I wonder if there
is a DIGI-COM 1 club or webring yet?

I may have Jan/Feb of 1992. Give me a few days to dig it out. Joe
Walters published his last CN in May/June 1995. Howard Carson of
Canada took over. His first issue was Sept/Oct 1995. IIRC, it did not
have 8-bit coverage. The last CN was Vol 16 no 5 about a year later. 7
Canadian issues - I think.

those who have copyrights on old dead software
like all atari software made and copyrighted before 2002
and all those advocating the validity and enforcement of those copyrights
should just lay off. your stuff is dead and for the sake of the machine
for the machines going down in history
let us share ALL software for free as it should be
so people will continue to notice atari and use the things
when your programes are available for sale you will have ground
i would love to purchase it. more so that to get a pirate
lets hope ATARI will follow the c1 charge. we need start tellin infograms what
up

Hello William,

Sorry but the article on SlashDot was a little misleading. Seems that a certain marketer has put the cart before the horse. The developers of C-One have already stated that C-One is not yet ready!

You can read Jens Schoenfeld's response in the CommodoreOne message archive:

http://groups.yahoo.com/group/CommodoreOne/message/7859

or on the C-One Details page:

http://www.geocities.com/profdredd/commodoreone/cmdrone.html

> So, is anyone gonna work on the "Atari 2003 XE"?

That would be very cool wouldn't it! :D

As it turns out, provisions are being made for exactly that kind of project. I beleive the idea is that you can buy C-One, download a file and have yourself an Atari xxx-XE/L or whatever. Jens has already stated publicly his desire to create an Atari version.

See, C-One is not built with limited/special-purpose chips as the classic computers of the 80's were. Instead C-One is constructed with modern, industry standardised components. All the magic happens inside the two FPGA's. Jeri has constructed her own "Super C-64" core for the FPGA's.

You will be able to develop your own cores for the FPGA's for whatever 8-bit computer you like. You'll also have the ability to download cores made by others. And the processor slot means you can do non-65xx computers too. some of us are already hoping for TI-99/4a :)

This was a mistake. The units are not shipping yet. I'm still
working on the early startup circuit that allows the user to write new
cores onto the harddisk and/or compact flash. I expect to have them
assembled and tested in about three weeks.

>

I've been worked on an 800 core several months ago, but had to put
it to the side to finish the new board layout.

You *could* actually create a raw format 360K DSDD disk with a few Pokes and USR call to configure the Percom block and send an SIO format command. You would then need a suitable DOS to make use of the space in any constructive fashion.

Hi folks,

Here's a letter from Petr Stehlik, the official maintainer of the
atari800 emulator. I consider this serious enough to make it public,
so I post this letter here unshortened and in original form.

> it's been more than two weeks since I asked you kindly to change the
> license of the atari++ to GPL. You haven't replied since then and
> neither the WWW page nor the released source code indicate any license
> change so I must get back to this unfortunate issue.
>
> As I told you in one of my previous mails, Perry McFarlane went over the
> atari++ code and found many similarities (same logical constructions,
> same variable names, same comments, same tables of data - copied even
> with the original bugs!) that clearly show the atari++ is a derivate of
> Atari800 which was released under the GPL. Eventhough you made many
> changes (Perry himself says you rewrote about 90% of the code), it is
> still based on Atari800 and thus covered by the GPL license.
>
> Please note I don't want to shut you down and you know this is nothing

> to wide public (Slashdot etc.) with story about this license violation.
> I hope we can solve this problem 'privately' without any unnecessary
> publicity. Please answer me soon. Thanks!

Since I don't want to go into any legal issues, and my main concern is
and always has been to develop excellent software, I decided it as the
best to resolve this issue by shutting the emulator project down. I do not
agree with Petr's view of points as, indeed, this emulator was re-written
from scratch.

I do not deny that I had access to the atari800 emulator; I did indeed, and
I wrote parts of its code. However, with atari++ I wanted to avoid the
problems that have been made in the old code, both constructional and
organizational. The design of the old code was rather unfortune, and for
my believe, part of this problem was indeed the GNU licence; it allowed
people without any further control to drill up the code, something that
caused parts of the trouble of the misdesign of the old code. I'm as well
responsible with my changes to this code that it became as messy as it was
back those years ago. Clearly, I cannot un-do the memories from those
changes, and some ideas have been carried over undoubtfully.

I personally didn't expect that it would be any trouble for anyone if I
would just demand to contact me before making changes to the source, but
aparently this is already demanded too much. I never had any commercial
plans with it, my licence conditions even forbid commercial distribution
to begin with. I tried to be as open with the sources as possible while
also keeping an eye on the code quality and setting the route for a long
term development that ends now earlier than I expected it to end.

I wish to express my deep thank to all the nice folks that helped me to
improve the software over the last month, and I sorry to have you to ask
to remove all traces of the software from your system, both binaries and
source code; but if the legal issues start nagging me, the project stops
being fun, and this is what it always has been for me in first place.

Sorry for the bad news guys, but such is life.

Greetings,
Thomas

Pity you haven't posted also the previous mails where I tried so hard to explain you that there's nothing wrong with GPL and that you should not be afraid of changing the license of atari++ to GPL.

> Since I don't want to go into any legal issues, and my main concern is
> and always has been to develop excellent software, I decided it as the

I am unhappy that I wasn't able to convince you that changing the license would be the best thing.

> I do not agree with Petr's view of points as, indeed, this emulator was re-written
> from scratch.

It is obvious that "from scratch" has a different meaning for you than for all the other guys that did have a look at your code and compared it with Atari800 source code.

> I personally didn't expect that it would be any trouble for anyone if I
> would just demand to contact me before making changes to the source, but
> aparently this is already demanded too much.

You are still missing the point. You got the Atari800 under the GPL. You started from it (not from scratch) and then released it under a different license. This is explicitly forbidden by the original license. I believe you can read the COPYING file by yourself - specifically the points 2, 5 and 8 that are just about this.

> I never had any commercial
> plans with it, my licence conditions even forbid commercial distribution
> to begin with. I tried to be as open with the sources as possible while
> also keeping an eye on the code quality and setting the route for a long
> term development that ends now earlier than I expected it to end.

I hope someone else will try to explain you why GPL would not cause any problem to you with keeping an eye on the code quality. I am too tired by repeating myself again and again. If you feel that Atari800 source code is a good example how GPL can cause messy codebase then better think of this particular example as
a failure of the maintainer (i.e. me) than a problem of GPL.

> Sorry for the bad news guys, but such is life.

There were several other solutions of this issue with the obviously best choice - the change of the license under which the atari++ is released.

Petr

Hi,

just a followup from me to me because I got a letter and I want to
react on it because I feel my intention didn't come thru as clear as
it should. I hope the author of the mail
(Jiri Svoboda <jiri.svoboda@ds-holding.cz>) accepts that I publish it here:

From:

> Personally, that's - unfortunately - TRUE :-( and I fully understand
> you.
>
> But you can switch your atari++ project to GPL license, and simply
> reject all the coming patches. Yes, other different forks of atari++
> code can be created then, but you will be the one and only master of
> your, "true", "real", "genuine" one atari++ project...
>
> Just my opinion.

First of all, let me make clear that I do not state that this is the
only "true", "real" or whatever project. Neither is my intention to
dismis all ideas about improvements of the project, nor any patches
concerning the project. I do not claim to be a genius and to do all
right others got wrong. In fact, I got a couple of very brilliant
ideas from the public that made it into the code. The 1.16 which just
got completed today has a DCM and .gz uncompression "on the fly" and
quite some other issues fixed I got as feedback.

I just believe that the GNU way of doing things is not the right way.

The GNU licence is a virus in form of a licence. Once you have it on
the source, all projects that are related to it get infected. This is
not what I consider "free software" because it forces the author of the
software into a legal status that might be unintended by the author in
first place. Freedom also implies that I have a word on what I do, and
that I'm responsible for it. Freedom does not mean for me to have to
follow a specific road. Freedom also means for me to have the right to
say "No". I tried as much as possible to express this in the
licence conditions I laid down.

/* snip */

Let me further post more of the discussion with Petr:

> > > To my best
> > > knowledge of GPL you should definitely change the license of atari++ to
> > > GPL as soon as possible. Please do it.

> >
> > Most definitely not. You might wonder why, of course. This is not

/* snip */

Petr didn't react on this. LPGL or BSD seems unacceptable for him.

> > Ok, what should we do about this now: One thing I can offer to modify

> modified Atari800. And second, I believe atari++ has roots in Atari800
> so you basically can't change the license. Do you want me to quote the
> GPL?

To answer this question here in this forum again: I *do not agree* that
the GPL has any saying concerning the atari++ as I wrote it. Interpreting
GPL the way you did implies that, as a commercial programmer, I would
never be able to even read GPL code legally because possibly I could use
parts of the ideas in commercial code. Even worse, having worked for a
GPL project requires me not to work on any similar commercial project
because I could possibly remember the GPL project and since I can't
avoid this as a human, I cannot start it.

In other words, GPL blocks fruitful software development, it forces
me into an organizational form that is part of the problem to begin
with, and that doesn't enforce strong quality ensurance as I want to
have; it furthermore blocks development of good software that might
be a good thing to have; I don't believe commercial software is a "bad"

thing as GPL seems to imply.

In a second aspect, Petr claims that I'm limiting the rights of the contributors of Atari800 I had when I modified it back then. Well, Petr does have the changes I made to the emulator the years ago, so there they are. But here's my work I wrote. I personally don't believe I'm stealing anything from anyone but rather provide much without asking for anything in return except to have a word on it. But as said, I don't feel like fighting this out. This is too much hassle for nothing. And about the last thing I want to do is to feed the lawers.

So long,
Thomas

There is quite a lot wrong with GPL.

>> I do not agree with Petr's view of points as, indeed, this emulator was re-written
>> from scratch.

> It is obvious that "from scratch" has a different meaning for you than for
> all the other guys that did have a look at your code and compared it with
> Atari800 source code.

"From scratch" has the meaning that I sit down, and start writing the code
without inserting any other code. Would you like to receive my CVS logs?
They clearly show that the code was written letter by letter by me typing
it into the keyboard.

> You are still missing the point. You got the Atari800 under the GPL. You
> started from it (not from scratch) and then released it under a different
> license.

I didn't. You got the modifications for atari800. That's it, and that's part
of the trade. Not more, not less. I have not released any part of atari800,
nor inserted, hacked up, included, reviewed, updated or modified parts of it.
I have no interest in the old code.

> I hope someone else will try to explain you why GPL would not cause any
> problem to you with keeping an eye on the code quality. I am too tired by

> a failure of the maintainer (i.e. me) than a problem of GPL.

It is the general construction of GPL that disallows me to concern over my
code in the full meaning of this word.

> There were several other solutions of this issue with the obviously best
> choice - the change of the license under which the atari++ is released.

This is the worst change for me, namely handing out a code under conditions
I do not want them to release. I never asked for money, but that one thing
I'm asking for, and I won't hand out what I own. This, Petr, is part of my
trade.

So long,
Thomas

From: oldgamerdon@aol.com
Message-ID: <20030204112500.11216.00000792@mb-ch.aol.com>
Source record: 23700

I subscribed to comp.sys.atari.8bit several years ago,
having fond memories of using the Atari 800 - - -
gosh, is it (20) years ! ago.

My old computer systems went from back closet
to 'paid storage' about ten years ago,
and now we have to cut out that expense.

My first - post asks for help: find a good home.

Willing to give all away for the postage required to ship
to you from New York

First carton has:

Boxed Atari 800XL
("More Memory Means More Power) - needs TV adapter

SoftSide Atari disks, (originals, 5" floppy format)
various, #23 - 45 (Nov 1981 - March 1983)

WICO Command Control Trackball,

This is fucked up. You're not doing this for any money and people are bitching? Now they just fucked over the enitre Atari 8-bit community who was looking forward to it. What's all this fucking crap about liscences? I don't read the licences when I use an emulator anyway. You were willing to give your time and effort into creating something we could all enjoy.

Fuck everyone who stands in your way. Assholes.

I'm sorry to hear that. I fear that I'm stepping into a tedious
GPL/anti-GPL flame-war, and I certainly don't want to fan the flames, but
I do feel compelled to say a few things, including a potential way
out....

>>> I do not agree with Petr's view of points as, indeed, this emulator was re-written
>>> from scratch.
>
>> It is obvious that "from scratch" has a different meaning for you than for
>> all the other guys that did have a look at your code and compared it with
>> Atari800 source code.
>
> "From scratch" has the meaning that I sit down, and start writing the code
> without inserting any other code. Would you like to receive my CVS logs?
> They clearly show that the code was written letter by letter by me typing
> it into the keyboard.

CVS logs will prove nothing. Hypothetically (and I'm NOT seriously
suggesting that Thomas did this), Thomas could have sat down with two
editors open and copied Atari800 source by re-typing it. Material can
also be infringing even if it wasn't a direct copy. OTOH, some code
snippets are likely to be identical between even completely unrelated
projects, simply because the structure of a problem or programming
language demand certain similarities.

In the interests of resolving this issue, I'd like to suggest public
disclosure of precisely what the Atari800 developers feel is infringing
material. This would allow for peer review of the claim that it's
infringing, which of course would not be legally binding, but might lead
to a solution that's mutually acceptable without forcing the elimination
of the Atari++ emulator.

>> I hope someone else will try to explain you why GPL would not cause any
>> problem to you with keeping an eye on the code quality.
>
> It is the general construction of GPL that disallows me to concern over my
> code in the full meaning of this word.

Personally, I have no problem with the GPL, and I agree with Petr that
the GPL would not preclude Thomas keeping control over his branch of the
Atari++ emulator. Most GPLed projects see that sort of control, but some
of them do eventually fork -- for instance, XEmacs from Emacs. The GPL is
not an impediment to Thomas's stated goal of maintaining code quality.
Hypothetically, a future fork of a GPLed Atari++ could go downhill, or
even a patched mini-fork (say, something included in a Linux distribution
with a patch to tweak behavior), but if Thomas wants to maintain control
of his own branch, nobody could force him to include either buggy or
brilliant additions to the code he releases on his Web site.

On the other hand, I personally also respect Thomas's aversion to the
GPL, even if I don't share that aversion. Some of Thomas's stated
objections have nothing to do with code quality, but rather with
philosophy, and Thomas clearly has very strong opinions on this matter,
so no amount of claims that the GPL is good will be likely to change his
mind. If Thomas wants to release code under another license (BSD, LGPL,
his own unique license, whatever), fine. That's his preference, and IMHO
it should be respected. Trying to brow-beat him into releasing under the
GPL will be counter-productive.

>> There were several other solutions of this issue with the obviously best
>> choice - the change of the license under which the atari++ is released.
>
> This is the worst change for me, namely handing out a code under conditions
> I do not want them to release. I never asked for money, but that one thing
> I'm asking for, and I won't hand out what I own. This, Petr, is part of my
> trade.

Again, I think the key to resolving this conflict lies in the allegedly
infringing code. If people don't get too hot under the collar about this,
perhaps a compromise could be reached, such as Thomas agreeing to replace
code that a neutral third party identifies as derivative of Atari800
code. If both sides agree to this solution, then this issue can be
resolved without resorting to lawyers. If both sides dig in their heels,
though, nothing will happen (or worse, it'll go to court), and nobody
will win -- not Thomas, not Pitr, and not the Atari community generally.

Obviously, this means that development will also cease on the Win32 port. This is too bad, because I was really enjoying working on the project and looking forward to getting beta feedback from a number of you.

Having viewed the source code from both emulators, it's hard for me to find much to make me think one was derived from the other. The only real similarity I see is that they are both excellent emulators, so I hate to see one go out this way.

> Sorry for the bad news guys, but such is life.

Indeed. Thanks to Thomas for allowing me to work on the port and for providing excellent help when I needed it.

Sorry but I can't believe it. It's hard to imagine such a coincidence
that variable names, comments, code structure and even tables of data
would be same or so similar if you really wrote it from scratch.

>> You are still missing the point. You got the Atari800 under the GPL. You

I have no idea what trade you mention but you copied parts of Pokey
emulation written and copyrighted by Ron Fries, for example.
Has Ron Fries given you his permission for it? I doubt it.

OK. You obviously didn't read the GPL yet as you would know it allows you
to ask for money. Anyway. We should stop here since we would only get
worse, not better, I am afraid.

Petr

Which "variable names"? CPU is completely different except that
the registers are named GlobalPC, GlobalA etc. as in the original work.
It is a one-cycle-step emulation using microcodes.
Antic has the register names from the hardware manual, how else. GTIA
P/M generation works quite different and has different naming conventions,
and the directly mirrored registers have the same names as in the HW
manual/customary Atari publications. Register mapping worked quite
differently than in my original work where I had a function pointer
per register. I've now a virtual class per page which turned out
more efficient. RAM/ROM settings are realized differently, no memory
is moved around in bank switching. POKEY sound related registers work
quite different and use a different data organization as well. IRQ
generation acts differently than the original and is kept back in the
CPU to implement SEI and CLI correctly. That never worked 100% correctly
in the emulator project I had back then.

>> I didn't. You got the modifications for atari800. That's it, and that's part

> I have no idea what trade you mention but you copied parts of Pokey
> emulation written and copyrighted by Ron Fries, for example.
> Has Ron Fries given you his permission for it? I doubt it.

Good that you asked. Did Ron Fries emulator provide the high-pass
filters? Not in what I've seen back then in the emulator I had,
maybe it does have it nowadays, but I haven't even seen that code.
Does it have the muting mode to push down the complexity and to
avoid high-frequency beeps? Does it provide 16bit/stereo output?
Does it include variable offsets for console speaker output? Does
it provide saturation and volume adjust? Does it provide pokey
interrupts? Let me mention that I implemented that in the old
code, so the names are of course similar.
Registers are organized differently, new lookup tables for AUDCTRL
have been inserted. There is, in fact, no completely different
algorithm to provide pokey sound output than to follow a list of
events, and to compute which event goes next: A pokey register
underflow, signaling an output change, or a sampling event to update
the output. If you want to avoid huge loops of doing nothing in

computations, that's the route to go. Now, blame me that I've used
this idea I remembered from Ron's code. Oh, and the minor detail
that all that is fitted into an OO design.

>> This is the worst change for me, namely handing out a code under conditions

Well,
buy one of those 7800 "super cartridges", like Ballblazer, Karateka and
others. All of those carts (labelled super-cartridge on the package)
include a Pokey chip. Mostly these carts are much cheaper, than buying a
single Pokey chip elsewhere... -Andreas.

Source record: 23709

Nope!
Besides, I do not know of any program package that includes all of these programs (as one package). hmmm, maybe the synapse programs, like syncalc, synfile, synhome, etc. (not sure if all of the synapse programs were really available). But the whole package had been tested years ago in Antic magazine and it also included a terminal program (300 or 1200 baud). otherwise you have to search for alternatives, with some limitations here and there. try Mini-Office 2, SAM (german GUI called Screen aided management) or use some PD programs like Speedscript, Speedcalc, BBK T-Edit, BBK Calc, etc. etc. -Andreas.

This is the problem. You "tried to be as open ... as possible,"
but in doing that, you violated the license of Atari800!

As Petr said, many people examined the source to atari++ that you released,
and posted comparisons between it and the current (and some older versions)
of Atari800. The resemblance could not have simply been coincidence!

If you wish to use GPL'd code and release it under another license,
you CAN... but you MUST get permission to do so from the copyright holders!!!

You can't just do it and say "Oh, but I wanted it to be better and it's still
'open.'" There's no clause in the GPL that says anything about your rights
to re-use GPL'd code under another 'open' license that you make up yourself...
(not without getting permission)

<snip>
> Sorry for the bad news guys, but such is life.

It's very sad that you're being so stubborn about this.

If this is the case, why do you feel compelled to "shut down" the atari++
project "for legal reasons?"

If, indeed, the code is all new (unfortunately, something not many of us
believe, having been shown comparisons of Atari800 and atari++ source),
then you're not violating the GPL, and have no reason to 'shut down'!

*sigh*

Hello all,

Before going into detail concerning similiarities between AtariWin and
Atari++ sources one should discuss the issue of using Atari OS-roms
(still copyrighted) first, since without these rom-images emulators
would make no sense.

Andre

This is true... except for the fact that it's very likely he based his
code on Atari800 (which is GPL'd), and therefore it is a violation of
the license to do otherwise... unless he gets permission from the copyright
holders.

# 754. Re: BeWe-DOS - Question

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-04 19:24:31 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3E40136F.FD135B6B@students.uni-mainz.de>
Source record: 23716

Well,
Bewe-DOS cannot format any higher than 360kbytes. Thus use the following trick: use spartaDOS to format a 16MB image, next copy the file bw130.dos on that image (or partition), next copy the file boot.com on that image, then load boot.com from that image and make bewedos bootable (command: boot bw130.dos). you should now have a 16MB image/partition with bewe-dos on it. It seems like boot.com has always to be on the same drive, as the file you wish to boot. So, if you want to create a 512k, 720k, 1024k or 1440k disk with Bewe-DOs on it, you have to go the same way: use sparta-DOs to format the disk, copy bewe-dos and boot.com on that disk and make bewe-dos bootable... -Andreas.

For those who are curious, this was discussed on the atari800 mailing list
last month.

(http://sourceforge.net/mailarchive/forum.php?thread_id=1546093&forum_id=3037)

Excerpt quoting Perry McFarlane:

When I looked at the code (written in C++) at first I thought it was a
completely new emulator (as Thomas claims.) But when I looked closer
at the Antic code, I thought it looked familar to me. Then when I did a
side-by-side comparison with the current Atari800 Antic code (re-written
by Piotr Fusik) there were not so many similarities. But when I
compared Thor's code with my old copies of the original antic.c by
David Firth and my first re-written version, there were a lot more things
in common.

So basically I think Thor's Atari++ is a 90% re-written version of a
very old version of Atari800, with perhaps some ideas from the newer
Atari800. It may be that not one line of code remains, but the basic
form and structure, as well as similar variable and function names reveal
to me that it is not entirely original. This would not be a problem, except
that the original Atari800 is GPL license, whereas Thor has his own
"freeware" license which prohibits modifying without his permisson. So
I was angry that he would build on someone else's code with GPL license
and then change the license and say other people could not do this to his
code. Also he gives no credit, so it is a kind of plagiarism.

I will give here a list of variable names and function names and code
ideas that are common to both Atari800(old version) and Atari++:

Pokeyscanline
nchars
GO (in cpu)
Xminscroll,xminnoscroll (antic) (not in new antic)_
dmawidth (vs dmaw)
ypos
*ptr++, screendata chdata
rundisplaylist
pmscanline

pmpixel
'fiddled' (from very old David Firth version)
implicit storage of player collisions
blankmask, invertmask
timing diagram
cycles diagram copied, including comments.
pokey: poly counter tables copied from Ron Fries (but they are wrong!)
event_min next_event
DivNCnt,DivNMax
Poly4Size,etc.

There is some copying from Ron Fries's Pokeysound as well.
For example our version of pokeysound uses the poly counter table I
determined which was the correct one, and Thor copies without credit the
erroneous one from Ron Fries's version.

In Thor's Antic code you will see things like:

```
UBYTE chdata;
// get screen data from antic buffer
screendata = *scan++;
// get character base address
chaddr = chbase + ((screendata & 0x7f) << 3);
// get character data
chdata = CharGen->Ram->ReadByte(chaddr);

if (screendata & CharGen->InvertMask)
chdata ^= 0xff;

if (screendata & CharGen->BlankMask)
chdata = 0;

if (chdata) {
*ptr++ = LookupTable[chdata & 0x80];
*ptr++ = LookupTable[chdata & 0x40];
*ptr++ = LookupTable[chdata & 0x20];
*ptr++ = LookupTable[chdata & 0x10];
*ptr++ = LookupTable[chdata & 0x08];
*ptr++ = LookupTable[chdata & 0x04];
*ptr++ = LookupTable[chdata & 0x02];
*ptr++ = LookupTable[chdata & 0x01];
} else {
/* Since HSCROLL is always done in the GTIA module, this is alig...
POKE4(ptr,GTIA::Playfield_2);
ptr += 4;
POKE4(ptr,GTIA::Playfield_2);
ptr += 4;
}
} while(--nchars);
```

Where our old antic code was like:

```
chaddr = t_chbase + ((UWORD) (screendata & 0x7f) << 3);
if (screendata & invert_mask)
invert = 0xff;
else
invert = 0x00;
if (screendata & blank_mask)
blank = 0x00;
else
blank = 0xff;
if ((j & 0x0e) == 0x08 && (screendata & 0x60) != 0x60)
chdata = invert & blank;
else
chdata = (memory[chaddr] ^ invert) & blank;
if (!(*t_pm_scanline_ptr)) {
if (chdata) {
*ptr++ = (char) lookup1[chdata & 0x80];
*ptr++ = (char) lookup1[chdata & 0x40];
*ptr++ = (char) lookup1[chdata & 0x20];
*ptr++ = (char) lookup1[chdata & 0x10];
*ptr++ = (char) lookup1[chdata & 0x08];
*ptr++ = (char) lookup1[chdata & 0x04];
*ptr++ = (char) lookup1[chdata & 0x02];
*ptr++ = (char) lookup1[chdata & 0x01];
}
else {
#ifdef UNALIGNED_LONG_OK
ULONG *l_ptr = (ULONG *) ptr;

*l_ptr++ = COL_6_LONG;
*l_ptr++ = COL_6_LONG;

ptr = (UBYTE *) l_ptr;
#else
UWORD *w_ptr = (UWORD *) ptr;

*w_ptr++ = PF2_COLPF2;
*w_ptr++ = PF2_COLPF2;
*w_ptr++ = PF2_COLPF2;
*w_ptr++ = PF2_COLPF2;

ptr = (UBYTE *) w_ptr;
#endif
}
}
```

The rest of the Antic code shows similar copying like this.

For comparison here is the MAME/MESS Atari 800 code:

```
#define RDVIDEO(o)
Machine->memory_region[0][antic.vpage+((antic.voffs+(o))&VOFFS)]
#define RDCHGEN(o) Machine->memory_region[0][antic.chbase+(o)]
#define PREPARE_TXT2(width) \
```

```
UINT32 *dst = (UINT32 *)&antic.cclock[PMOFFSET]; \
int i; \
for( i = 0; i < width; i++ ) \
{ \
UINT16 ch = RDVIDEO(i) << 3; \
if( ch & 0x400 ) \
{ \
ch = RDCHGEN((ch & 0x3f8) + antic.w.chbasl); \
ch = (ch ^ antic.chxor) & antic.chand; \
} \
else \
{ \
ch = RDCHGEN(ch + antic.w.chbasl); \
} \
video->data[i] = ch; \
}

#define POST_TXT(width) \
antic.steal_cycles += width; \
if( --antic.modelines == 0 ) \
antic.voffs = (antic.voffs + width) & VOFFS; \
else \
if( antic.w.chactl & 4 ) \
antic.w.chbasl--; \
else \
antic.w.chbasl++

#define MODE2(s) COPY4(dst, antic.pf_21[video->data[s]])

void antic_mode_2_32(VIDEO *video)
{
PREPARE_TXT2(32);
REP32(MODE2);
POST_TXT(32);
}
void antic_mode_2_40(VIDEO *video)
{
PREPARE_TXT2(40);
REP40(MODE2);
POST_TXT(40);
}
void antic_mode_2_48(VIDEO *video)
{
PREPARE_TXT2(48);
REP48(MODE2);
POST_TXT(48);
}
```

You can see here that MESS is not copied from Atari800, but Thor's code is obviously copied because of the similar variable names and code structure.

(Note: The above was copied-and-pasted from the web interface to the mailing list archives, and then cleaned up (spacing and indenting) some for readability when I pasted it here in this posting.)

The viral "share what changes you make" aspect of the GPL is the
_price you pay_! If you want to release your code under the some other
license, go pay [*] for a license to something like Rainbow or PC XFormer!

Or hey! Maybe ask the copyright owners of the GPL'd code if perhaps they'd
be willing to let you release your derivative work using some other license.

Well,
as a famous last (and completely nonsense) word: Who gave you -the atari 800 developpers- (or anyone else) the permision to emulate anything ? Atari ?? I don`t think so. Who gave you the permission to create a program (called an emulator) that mostly works with pirate software and even forces the user to hunt for pirate software ?!? As a developer of any sort of emulator I would never throw stones or complaints on anyone - since writing an emulator in the first place/right from the start is not completely legal!!

Besides, if you try emulating any Atari chip (Pokey, GTIA, Antic, etc.) and you try to do it almost perfect, I don`t think there are 1000 ways to do it. Or at least 999 ways will be very similar... (just like the 8 Queens problem)... -Andreas.

The ROMs were made available by Hasbro back when PC Xformer was first being released by Darek Mihocka (Branch Always Software, now known as Emulators, Inc.)

Realize that the ROM images are NOT distributed with Atari800.
Rather, a freely-redistributable version of PC Xformer is hosted at the Atari800 site (xf25.zip), from where you can extract the ROMs legally.

Source record: 23725

This was one of the best emulator developments in recent years. Thomas even did some great work on the Atari800 emulator itself. Why would it hurt the other Atari800 authors to let him release under this license? It is not like he is trying to make money and not release back changes at all. The code is so branched (read: totally changed) that the patches couldn't even be directly applied to Atari800. Its even in a different language!

The GPL is used to take something great away.... Please Atari800 coders stop being so petty and let Thomas continue this great project.

Mark

> legally.

A few more words about Xformer 2.5.

From XF25.DOC:

Copy this program!
------------------

PC Xformer 2.5 is a free emulator for MS-DOS users who wish to run their old
Atari 400/800 and Atari 800XL software on their PCs. The file XF25.ZIP may be
freely redistributed under the condition that the contents of the ZIP file
are not modified in any way, and that no fee is charged for the software
other than reasonable long distance and online charges for downloads.

The ZIP file (xf25.zip) is being hosted by the Atari800 project
(at SourceForge.net) exactly as it was distributed by Branch Always Software.

It's being made available for free.

Darek mentioned on comp.sys.atari.8bit, comp.emulators.misc and
comp.sys.mac.misc:

As far as my Xformer emulators go, I got permission from Atari back in
1987 to include their OS images in my emulators. You're notice all
versions of Xformer carry Atari's copyright notice and a "used with
permission" notice.

As far as Rainbow and STonX and all these other Atari emulators that
aren't obtaining any sort of permission, well, they're on their own.

( http://groups.google.com/groups?selm=3vrlf2%245on%40news1.halcyon.com )

This is exactly why Atari800 doesn't include the ROMs directly,
but instead simply suggests people grab their own ROMs from their Atari
directly, or use the ones that come in XFormer.

Why would it hurt for Thomas to ASK for this permission, rather than just
taking it (thus violating the license the software was released under)?

> It is not like he is trying to make money and not release back changes at
> all.

That doesn't help Atari800, unless he specifically grants rights to the
Atari800 developers to use his code (which would then be released as GPL,
as per their current license).

> The code is so branched (read: totally changed) that the patches couldn't
> even be directly applied to Atari800. Its even in a different language!

So? Does that mean that all of the work people donated to the Atari800
project, under the assumption that their code would be 'Free' (capital F)
doesn't count, all of a sudden?

I haven't done much actual development on Atari800, but even I feel kind
of ripped off by all this.

> The GPL is used to take something great away....

So are all licenses! GPL is just the most end-user- and developer- friendly.

> Please Atari800 coders
> stop being so petty and let Thomas continue this great project.

I'm beginning to wonder if anyone here has even READ the GPL. >:^(

Mostly. It would be better if the actual code/version that run on 8 bit
machines would get released. Titles/trademarks should continue to be
copyrighted so derivative works like Ms. Pac Man 2020 could be developed.

IMO code should be patented<vs. copyrighted> so legal protection should run
out in 17 years.

It wouldn't hurt, but obtaining permission from all past developers may be
hard. Simply because of problems locating them. But remember he does claim
he did not take the code.

> That doesn't help Atari800, unless he specifically grants rights to the
> Atari800 developers to use his code (which would then be released as GPL,

Maybe he should gran them permissing to refactor his code. I.e. no direct
use. Thomas: Why not? As I understand it, only any code that they use would
become GPL. Not the whole Atari++ project.

> So? Does that mean that all of the work people donated to the Atari800
> project, under the assumption that their code would be 'Free' (capital F)
> doesn't count, all of a sudden?
Their code is still free in Atari800. He hasn't taken away any of that.
Only added.

> I haven't done much actual development on Atari800, but even I feel kind
> of ripped off by all this.
How does this rip you off. Something is now available that was not
available before? Nothing that was available before is no longer avaiable.

>> The GPL is used to take something great away....
> So are all licenses! GPL is just the most end-user- and developer-
> friendly.
The GPL is aimed to promote freedom. It is only written as such because
that is necessary with the current legal system. I may be wrong:-)

>> Please Atari800 coders
>> stop being so petty and let Thomas continue this great project.
> > I'm beginning to wonder if anyone here has even READ the GPL. >:^(
I have. I decided not to release any of my own projects (e.g. BeOS G400
driver) under it.

Look at his license, compared to the GPL. He has stripped & changed the
rights we had as developers to be able to still use our code after it had
been adapted and changed in the future.

It's not a matter of "is it still free, is the code still available."
It's simply a matter of changing the license; the rights we granted others
has been taken away from us, and those other people.

That's the whole reason I assume the GPL was chosen by the original Atari800
developers: to /protect/ these rights!

<snip>
> I have. I decided not to release any of my own projects (e.g. BeOS G400

>

And that's your right.

Thomas did NOT have the right to take the Atari800 code and release
something under a different license. Noone gave him that right,
otherwise we wouldn't be asking him to remedy the situation.

(Of course, all he seemed to do is kill the project, while still claiming
innocense... and all that led to was people getting pissed off at the
original Atari800 developers... without whom we'd have NEITHER Atari800
nor atari++ to /begin/ with!)

This is not true. Only two 7800 carts contain Pokey. I think Ballblazer
and Commando(?).

Hello All,

I've just started new auctions for: SpartaDOS R-TIME8 disk, 2 issues of 8:16 magazine, one issue of Atari Interface magazine. I still have the 850 field service manual, and DGS light sensor box for auction too, along with some non-Atari items (ZX81 board and a 1975 PDP11 software handbook!)

The link is below (this will split on to two lines, so please copy both lines into yourbrowser):

Source record: 23734

>(Perry himself says you rewrote about 90% of the code),

Situation:
i) Can not release current code under GPL because 10% is allegedly derrived
from a GPL work written by other programmers.
ii) Atari800 authors will not let this 10% be released under Thomas'
license.
ii) Thomas is not happy releasing the other 90% under GPL.

Why kill the project, rather than rewriting the other 10%? Seems like a
large waste otherwise. Is anyone willing to help rewrite this 10% and give
the code to Thomas? How many modifications need making to this code before
it can be considered to be rewritten?

If Thomas or others are willing to donate their time coding it, and
releasing it under Thomas's license, then yes... that's a perfectly
reasonable solution.

Yes, it's completely legal to rewrite that 'common' part and yield
complete non-derivative work and put it under _ANY_ license.

But all versions including those 10% of code _MUST_ be released under
GPL.

(Sigh)

As far as I can tell, this is so petty. It's not as if anyone is losing any money on the thing. As for the "fame" part of this "fame and fortune" deal, we all know how much effort was put into the Atari800 effort, and the Atari 8-bit world owes the developers a deep debt of gratitude since they almost singlehandedly kept the flame burning during its darkest days. Any spotlight that is thrown upon Thomas' project only makes the original Atari800 project shine more brightly.

I don't understand what is trying to be accomplished here. All I know is that there's a lot of creative energy out there that is just going to waste now.

BTW - Realize I'm talking about _new_ code being untainted by the GPL.

If one takes existing code and changes it (e.g., ports to a different platform, compiler or language... change the variable names, or even tweaks and rewrites it 100 times), it's still taking code, and therefore you need to respect the license. (That includes providing credit to the original authors, for example!)

I was given enough reason. This whole discussion isn't worth it. I prefer
writing software, not discussing licencing issues, neither feeding lawyers.
I'm not spending my mental health for a piece of software, or "to be right"
so I'll better leave this alone.

So long,
Thomas

> taking it (thus violating the license the software was released under).

"violating"? Oh well. I doubt that. But then: The fact that I'm feeling
now a spanish inquisition makes my doubts about GPL even worse. Id didn't
expect so much trouble for releasing it under anything that is almost
the same spirit as the GPL.

>> It is not like he is trying to make money and not release back changes at
>> all.

> That doesn't help Atari800, unless he specifically grants rights to the

> as per their current license).

Why shouldn't I? Have you read my licence? The full point is about *not*
blocking the development. You can read it, use it, whatever you want. This
is exactly the freedom I want to grant. But what I do not want is uncontrolled
modification of the sources. I hardly ever want you to stop using the algorithms,
the methods or parts of the code within.

>> The code is so branched (read: totally changed) that the patches couldn't

As free as I can offer it. Did I say that you cannot use it?

> I haven't done much actual development on Atari800, but even I feel kind
> of ripped off by all this.

Do I take anything away from you? I *offer* something for nothing, even
for "more nothing" than GPL, and it is this "more of nothing" I want to
have on the source.

>> The GPL is used to take something great away....

> So are all licenses! GPL is just the most end-user- and developer- friendly.

No. It forces developers into a development mechanism that might not be suitable
for all projects and all kind of developments. It is exactly that I do not want;
I prefer a mechanism where one guy is responsible for the lifetime of the project
and controls the route of the project. While I'm a firm believer of democracy,
I do not believe that a pure count of noses always provides the right answer, and

a wrong decision at one time might turn out better than just several "almost right" ones. It leaves the design of a project to someone who has the last word to say on it. This might turn out to be the wrong word some time or another, though I believe that this is the better mechanism because it at least grants a software design as a whole.

Greetings,
Thomas

Exactly..

I'm not a coder (well not emulation wise) but at the end of the day
Atari800 could use the graphic's engine of Atari++ or Atari++ could keep
going.

I hope this get's ironed out, from what I can understand if Atari800
wants to get the scanline / pixel thing sorted it needs a graphic engine
rewrite (I could be wrong here) and there's Atari++ with it and maybe
other things (based on my small play with the Win version).

I don't know the in's and out's of the GPL thing, I would understand
peoples anger if code was used but all I see is this awful waste of
talent either way.

Come on people, sort this out and have 2 emus, 1 emu or whatever but
lets use the grey matter to push forward and not argue if possible.

Since it's the core of Atari800 that powered Win Plus and it being the
bit that needs altering it makes no odds.

> rights we had as developers to be able to still use our code after it had
> been adapted and changed in the future.

Where?

/* snip */

(iii) Other forms of distribution, provided you received a prior written
agreement with the Author. While this Licence does not state the rules under
which the Author will allow redistribution except those mentioned in
points (i) and (ii), it can be expected that the Author will, in general,
accept redistribution of this Program in a "Linux Distribution" like
Debian, RedHat or SuSE that come with licences that follow similar guidelines.
Please contact the author for further details to come to an agreement.

Redistribution of a modified version of the Archive, the Program or the
contents of the Archive is prohibited in any way, by any organization,
regardless whether commercial or non-commercial. Everything must be kept
together, in original and unmodified form. Specifically, this prohibits
the distribution of a modified (or "patched", "fixed") version of the
Program without prior agreement of the author concerning the modification.

/* snip */

This specifically implies that you may not modify the existing code,
but there is absolutely no clause that prohibits to read the code,
and use parts of it.

> It's not a matter of "is it still free, is the code still available."
> It's simply a matter of changing the license; the rights we granted others
> has been taken away from us, and those other people.

And this is what makes me feel doubious about GPL. We have here language
lawyers that insist on "it must be this licence or none". I do not play
this game. GPL is not the holy grail, and some other forms of free
software production have their rights and usefulness. However, I always
get a wierd feeling when people argue about GPL that "their" licence
is rather ideological grounded than by practical purposes. The GPL is
a political question, not a question of usefulness. But I do not play
this game, I do not want to do politics. I want to write software.

> That's the whole reason I assume the GPL was chosen by the original Atari800
> developers: to /protect/ these rights!

I protect the sources for the best of the product, not to hide
it from public, whereas GPL tries always to protect it "from those evil
non-GPL'ers". If hiding rights would have been my intention, I wouldn't be as
stupid as to distribut source code. I *want* to make sources available.

For that I would have to know what the 10% are that are claimed to be under GPL. If someone compiles a list, I'll do that as well.

Anyhow, this seems a bit childish to me as it is free code the one way or the other, but if all the lawyers out there seem that this step is necessary, fine for me and I'll write parts of the emulator now for a third time. *sigh*.

I pretty much feel that the requirement to argue about this gives me just another good reason why I do not want anything GPL'd. I feel tired.

Greetings,
Thomas

Those exact things there would SPECIFICALLY keep atari++ out of
Debian. (Maybe it could get into non-free)

> This specifically implies that you may not modify the existing code,
> but there is absolutely no clause that prohibits to read the code,
> and use parts of it.

That seems to contradict itself. If I can use parts of it, why can't
I just use all of it, and therefore create a modification.

I think we all see what you're trying to do with your license, but
that's not the problem. The problem is violation of the GPL. Period. :^(

I have no intend to hide this technique from other emulators. That
is why this is public code to begin with. I just don't want to put
this technique under GPL.

>> > Why kill the project, rather than rewriting the other 10%? Seems like a

>> releasing it under Thomas's license, then yes... that's a perfectly
>> reasonable solution.

Reasonable? That is reasonable? Rewrite free code to get another piece
of free code? Oh well, if that must be, then it must be; but this is
precisely why I hate lawyers and like mathematics. Lawyers keep laws by
the word, mathematicians by the sense. The sense of free software is to
keep it free, not to have rewrite it to get it into another flavour of
free. The aim of my licence is to avoid that someone rips of the source
and makes money with it because someone else would otherwise owe it, and
to keep the code in good shape. The reason for GPL is not that much difference,
with the exception that it infects programs and prohibits usage of algorithms
by putting them under a viral condition.

My brain hurts....

Compile a list, and write what kinds of techniques you would accept as
"not acceptable" because they are covered by GPL. Oh well, this is even
worse than this stupid LZW patent that...

I want to avoid those issues in first place, and now I'm right in it.

So long,
Thomas

Thomas Richter <thor@cleopatra.math.tu-berlin.de> wrote:
> Reasonable? That is reasonable? Rewrite free code to get another piece
> of free code?

It's not a point as to whether it's "free code" or not.
(Whatever your description of that is.)

The point is the license was violated, and this needs to be remedied!

All of this GPL bashing and "wah, it should just be free!" crap that others
have been posting is simply avoiding the issue.

It doesn't matter that it's the GPL. What matters is that the license
that Atari800 was released under says, specifically:

"...if you distribute copies of such a program, whether
gratis or for a fee, you must give the recipients all the rights that
you have."

and:

"...2. You may modify your copy or copies of the Program or any portion
of it, thus forming a work based on the Program, and copy and
distribute such modifications or work under the terms of Section 1
above, provided that you also meet all of these conditions:

"a) You must cause the modified files to carry prominent notices
stating that you changed the files and the date of any change.

"b) You must cause any work that you distribute or publish, that in
whole or in part contains or is derived from the Program or any
part thereof, to be licensed as a whole at no charge to all third
parties under the terms of this License..."

If people don't like this license, then by all means, stop using
Atari800. And for chrissake, DON'T grab the source-code and re-use
it unless you abide by the license.

This goes for ALL licenses! Not just the GPL.

-bill!

## 788. Links to help explain license issues (GPL, Atari800, atari++)

First off, I'd like to apologize for all of the ranting that's been going on here today. I was just EXTREMELY upset that Thomas turned around and made Petr and the rest of the Atari800 guys out as if they were trying to kill his project. All they want is their rights protected.

I'm going offline in a moment (in fact, to go listen to a talk about the Digital Millenium Copyright Act, another issue of rights in the electronic age) but wanted to waste a little bandwidth posting some reference URLs for people who are concerned about the whole licensing issue between Atari800 and atari++:

First off, the GPL itself, under which Atari800 is licensed:

http://www.fsf.org/licenses/gpl.html

Free Software Foundation's FAQ on the GPL:

http://www.fsf.org/licenses/gpl-faq.html

The Open Source Definition. This is an annotated and very readable description of what the term "Open Source," as defined by the Open Source Initiative, means. Note that the GPL is just one example of an Open Source license.

http://www.opensource.org/docs/definition.php

Debian.org's discussion of "What does Free mean?"

http://www.debian.org/intro/free

The Debian Free Software Guidelines (DFSG). The Open Source Definition was based off of this, and this is another very easy-to-read, point-by-point description of what 'Free' software is. This is the set of commitments that the project contributors abide by:

http://www.debian.org/social_contract#guidelines

Copyright laws exist for a reason. That reason is to make sure that your
work cannot be stolen. The Atari 8-bit community doesn't come into it,
unfortunately. I stand by the rights of the Atari800 orginal authors. If
Thomas wants to persist in his claim (perhaps legitimate, I don't know) of
writing Atari++ from scratch, then he may have to face legal action.

I'm sure you wouldn't want it any other way, either. After all you
probably would want some recourse if someone walked up to your house and
stole your car, wouldn't you?

If I wrote an emulator for the Atari 8-bit and someone else wanted to
improve on it who wasn't using my work for a profit, I would not only
encourage him but help him to improve upon my work, not start bitching and
whining like a little girl.

Well, that's you. The Atari800 guys obviously wanted their work under GPL.
They have no less right to chose how their work is distributed than you do.

I do want the Atari++ emulator to be released and I want the pixel-level
screen emulation to get to us users. I don't want it to come at the
expense of anyone's rights though. This is all assuming that Thomas did
indeed modify existing GPL'ed code from the Atari800 core project. I have
no direct knowledge of facts there.

I personally would release any code I write under a very liberal license,
like the Allegro graphics library I use sometimes on the PC side. Copy it,
modify it, sell a program written with it... whatever, just don't claim you
wrote it yourself and always credit the original author, even of a
derivative work.

Actually, that's NOT the reason copyright exists, at least not as codified
in the US Constitution:

: The Congress shall have power to . . . promote the progress of science
: and useful arts, by securing for limited times to authors and inventors
: the exclusive right to their respective writings and discoveries

Thus, the purpose of copyright law is to encourage development of the
arts and sciences. The idea that copyright exists to prevent "theft" is
spin put on it by the media industry.

That said, I don't know what the stated purpose of copyright laws are
outside of the US, and it's quite possible that the stated purpose in at
least some countries is the personal enrichment of copyright holders.

> and use parts of it.

That depends on what you mean by "use." IANAL, but my reading of your
license is that nobody can use any of your code in any other product
without your express permission. Doing so would be considered creating a
derivative work ("modified... version" in your language). Even a few
lines of code (some would say a single line of code!) could theoretically
"poison" another project -- precisely the problem you're facing, but in
reverse.

Given your e-mail address and use of language in your posts, I'm guessing
you're not a native speaker of English. Thus, you may not fully
understand the subtleties of meaning in what you wrote, and your intent
may have been different than what actually comes out of your license.
That license isn't particularly open -- it certainly does not meet the
requirements for an open source license, for instance. I doubt if many
Linux distributions would have included your program for that very
reason, even if you had not pulled it.

Of course, all of this has nothing to do with the alleged GPL violations
of your code. Even if you'd used another open source license (the BSD
license, say), it wouldn't matter; the "price tag" on GPLed programs is

that derivative works must be GPLed. (The copyright holder can grant another license to specific individuals or organizations, of course.) If you don't want to pay that price, don't try to use GPLed code in other works. Whether or not that's what you did is not for me to say, though. If you sincerely believe you're innocent, then again, I suggest that both parties set aside the "my license is better than your license" rhetoric and agree on a neutral third party to judge the potentially infringing code. You can then release new code to replace anything judged to have been derived from the Atari800 code base, or just ditch the whole project as you seem to be doing now. If you really want to contribute as you say you do, this (or even just caving in and writing new code for all claimed infringing code) is the best option.

> For that I would have to know what the 10% are that are claimed to be
> under GPL. If someone compiles a list, I'll do that as well.

No. The whole derivative work (atari++) should be either released under the GPL or not at all. The reasons were posted in this thread many times.

I am not a lawyer - I am a programmer. That's why I can see a potential way out of this which might not be 105% legal (according to the GPL) but which I believe would work for most guys involved in this issue.

First, rewriting 0-100% of the atari++ is not going to make it. It will always be tainted by the GPL. Thus don't even think about it, it would be wasting of time.

Second, to fulfill the original license while not releasing the derivative work under it you could do one thing: ask all those Atari800 authors and contributors (up to the version 0.8.x or which one was the latest you had a look at) if they allow you to use their code under a different license. Their "OK" is IMHO the only way how to release atari++ legally. Are you following me so far?

And for this to work (for getting their "OK") you would need to do two very SIMPLE and very LOGICAL things (logical from my programmers standpoint):

1) CREDIT THE WORK of the original authors properly. This is a must, otherwise the release of atari++ can be considered as a theft of their IP (sorry for such strong words but I have heard them from the affected programmers).

2) CHANGE THE THOR-LICENSE so that it allows everyone to fully re-use your code and modify it _FREELY_ (outside of atari++ project) so that everyone and especially those that built Atari800, can make use of your work (that in turn is based on theirs work). No written permission or anything like that, please. Don't try to limit the freedom, be as open as the GPL is.

Thomas, I believe that you actually have no problem with any of the items above since you repeated in this thread several times that you want your source code to be freely usable by others (though your current THOR-License does not allow that - see post by Rob and others). As for crediting the original authors - I feel it's so natural that I am not even going to talk about it. I believe that this is simply automatic thing for every normal programmer.

This is my offer how to keep the atari++ project alive. I haven't consulted it with other guys in Atari800 mailing list but I still believe it's a very fair offer and that they would agree with that since nobody had any intention to stop the atari++ project - we just want our rights to be fulfilled.

Petr

Hence the 6502 processor is copyright, you aren't allowed to reverse engineer, duplicate it etc. I don't recall it ever going free-issue so anyone insisting they have a water-tight legal right to control software that exactly duplicates its instruction set and operation will have a hard time proving they possess any rights at all.

Grow up team. Do any of you have wives? Let them decide what to do. Too much testosterone flying around over a bloody toy.

A modified version is something different than derived work. This doesn't contradict itself, but rather requires clarification at times a potential licence break is detected. If parts of the code have been used, I don't care. If major parts have been used, I would call this a modified version. What exactly is "major" depends on the situation. It is part of the deal that I believe that you really cannot copyright ideas, and for that reason, cannot copyright algorithms. (Some recent developments go into an opposide direction, but I don't agree with them). If a part of the code has been extracted, understood and used to write another software, I should be happy to have launched off an interesting development. If huge parts of the code have been re-used, then the second party clearly showed no interest in understanding the idea, but rather tried to rip off code to avoid some intellectual work. Thus, I wouldn't expect anything interesting from the second kind of party. This is the difference I want to express in the licence conditions.

So long,
Thomas

The point is that you *clame* that a licence has been violated, and I
do not agree.

> "...if you distribute copies of such a program, whether
> gratis or for a fee, you must give the recipients all the rights that
> you have."

Except that this is not "such a program".

Algorithms can't be copyrighted, although they can be patented, at least in the US. Specific implementations of algorithms, though, can be copyrighted.

> Compile a list, and write what kinds of techniques you would accept as
> "not acceptable" because they are covered by GPL.

The claims I've seen posted against you have nothing to do with your using specific algorithms; the claim is that you took actual lines of code from Atari800, reworked them slightly, and released them under a non-GPL license. If you're interested in rewriting your code, the appropriate question isn't the one you just asked; it's "what lines in what files do you believe are derivative of Atari800 code?" To fix the problem, you need to do more than minor tweaks to the code; you need to completely rewrite it. The rewritten code might conceivably use the same algorithms, but it shouldn't be derived from the original. Of course, judging what's derivative and what isn't derivative is somewhat open to interpretation.

> I want to avoid those issues in first place, and now I'm right in it.

If you're going to release code publicly, you always run the risk of running into these sorts of problems, no matter what license you use. If somebody spots a similarity between your code and theirs, and if their license doesn't allow you to use their code with your license, the other party is likely to squawk. You'd have avoided the brunt of this particular problem if you'd released under the GPL, but hypothetically, if somebody using some other license (say, a standard commercial license) noticed a similarity, you could still end up in hot water. That's simply the risk for playing this game.

As a meta-comment, and please take this as constructive criticism and not an attack, I get the impression that your understanding of intellectual property law, licensing issues, and what makes a derivative work are not as good as they should be for somebody who's publicly released more than very trivial code. It is in some sense unfortunate that you as a software developer have to be concerned with these issues, but you do, and before

somebody chimes in bemoaning the existence of these laws, remember that they can cut both ways -- the same laws that prohibit you from releasing GPLed code under another license also prohibit somebody else from releasing modifications to your code under a license you don't like. In any event, there are quite a few Web sites and books on legal issues and software development; a Web search or a search on Amazon or the like will turn these up. I recommend you do some reading on this issue before releasing code again. It might save you some grief. For all that William has gotten a public beating for trying to enforce the GPL, it could be far worse. A less understanding person or organization could take you to court over something like this. I understand your desire to avoid these issues, but that's like saying you want to avoid crowds and then living in a big city; it comes with the territory.

Please don't walk away from this thinking the GPL is the villain. Most software licenses have restrictions of one sort or another. Heck, I recall a fuss a few months ago because somebody identified some part of the Linux kernel that appears to have been derived from BSD code. The BSD license permits this, so no problem, right? Wrong. The allegedly infringing Linux code didn't include the original BSD copyright or authorship attribution, so a stink bomb went off.

There are also far worse licenses and license holders. For instance, suppose for the sake of argument you'd seen some Microsoft code in a college course, as part of their "shared source" program. If your software bore any resemblance to that code and Microsoft found out, you'd probably have heard from their lawyers first, not a polite request from another developer to change your license.

Yes:

: Redistribution of a modified version of the Archive, the Program or the
: contents of the Archive is prohibited in any way, by any organization,
: regardless whether commercial or non-commercial.

I suspect you don't realize it, but this sentence does prohibit "use," in the sense of use of your code in others' programs. A subsequent sentence implies you'll grant exemptions on a case-by-case basis, but that's not much consolation -- the default condition is very restrictive, and judging only from the license, you could arbitrarily withhold such permission. It's not clear from the brief bit of your message I've snipped, but I get the impression you're making a distinction in your mind between the entire program and parts of it. That distinction is NOT clear in your license, and copyright law (certainly in the US, and I'm pretty sure in most other industrialized countries) doesn't make much distinction between the entire work and parts of it, aside from "fair use" provisions, such as quoting brief passages for a review. AFAIK, no fair use provision would cover use of small snippets of your code in another work.

There's also the claim of a GPL violation. Whether or not you (or anybody else here) agrees with the GPL's philosophy is irrelevant; if you use the code, you play by their rules. Agreeing to give back under other conditions doesn't satisfy the GPL. That's what the GPL and copyright work combine together to do. You could, of course, negotiate a separate license for use of the code with the copyright holders, but doing so can be tricky on large projects with lots of contributors. If the tables were turned (and assuming a verified violation; in my mind, yours is still only alleged), you'd have every right to demand removal of your code from a GPLed product, given your own license terms.

re: the GPL:

> right" ones. It leaves the design of a project to someone who has the
> last word to say on it.

That's not what the GPL says, nor is it an implication of the GPL. Many GPLed projects have clear leaders with the final say-so for the inclusion or exclusion of any code patch. I know that Linus Torvalds, for instance, has rejected some popular submissions to the Linux kernel because they don't match his vision of what it should be like. Of course, with the GPL, somebody who doesn't like the direction a project is taking can create an alternative fork (for example, XEmacs forked from Emacs). Your own license would prevent this from happening without your permission. For instance, the Windows port that's been underway wouldn't be legal without your approval. From what I've seen, you appear to have encouraged this port, but that's beside the point -- hypothetically, if you'd been rabidly anti-Microsoft or arbitrary about it, you could have forbidden it, given the terms of your license. Also hypothetically, if in the future somebody wanted to update the code for new OSs or new versions of current OSs, and if you couldn't be contacted for any reason, those potential future developers would be out of luck; your license locks your code off for anybody who can't contact you.

Please note that I'm not trying to get into the "my-license-is-better-than-your-license" shouting match; I'm just trying to point out some of the implications of your license that you appear not to have recognized, and to point out some of the incorrect inferences you've made about the GPL. You don't like the GPL for political reasons and prefer the BSD community's definition of "free" with respect to licenses. I can understand and respect that, and I'm not going to debate that issue. I've seen far too many flame-fests that get nowhere on that issue, so I'm just trying to kick out some ideas that are potentially more productive.

Thomas, I saw Perry's comparison on the A8 mailing list. Your code has data tables with the exact same comments AND THE EXACT SAME ERRORS as are in the older A8 code you obviously based A++ on. Those errors were since discovered and fixed in A8, but how do you explain your code having those identical errors?

Look, I don't think anyone on the A8 side was all worked up over this since 90% of the code is new, or at least rewritten enough not to be recognizable, they mainly just wanted you to indicate your code's origins from the A8 project, but your insistance it is written from scratch doesn't go over well with any of the A8 developers given the examples Perry showed them, and your attack on the GPL has reminded them of their rights that you trampled.

You have a very strange idea of what is "free code". Your license takes away the right to modify your code which by definition renders it non-free. The code isn't "public" just because you released the source, nor is it "free" just because you released the source, its non-free because of the license you attached to it. You believe it is "in the spirit" of the GPL as you said in one post, but claim at the same time that the GPL is a virus. You are wrong on both counts, your license is as far from the true spirit of the GPL as one can get, and there are a *lot* of people that don't believe in the virus nonsense. Thats what Microsoft claimed when they tried to convince people the GPL was evil, but no one bought it, so they switched tactics. I suggest you switch tactics too.

Are you going to throw all that good code away because you can't control it exactly the way you want? You've already written 90% of it, why not finish the job and rewrite the last 10% that is recognizably from the A8 project? I

don't understand how you could put so much work into this only to throw it out and walk away with no one, including you, gaining from your effort. If you've really given up, why not release what you have under the GPL so the other emulator projects could benefit from your work, or are you so hateful of the GPL that you'll destroy your work, to the detriment of everyone here, rather than let others work on and improve your creation?

## 808. Atari800 Emulator Programmers show true colors

Source record: 23621

I've got REAL hardware and software and rarely use the buggy emulators.

Apparently the Atari800 emulator programmers feel their programs are their property. So stated. So be it.

If I use their program, I 'owe' them. I owe them because these programs are not freely given. Their 'free' contribution to the Atari community is nil.

I do not wish to 'owe' anyone anything. ALL Atari800 emulators are now deleted from my system. Their are other emulators. I advise all atarians do the same, or better yet, use the REAL thing instead.

Richard Heldmann

No, it does not. "The Program" is a well-defined term. An algorithm taken
from "The Program" is not "The Program", hence this term does not apply.

> There's also the claim of a GPL violation. Whether or not you (or anybody
> else here) agrees with the GPL's philosophy is irrelevant; if you use the

As there is no GPL on this code, I'll play by my rules.

> Agreeing to give back under other
> conditions doesn't satisfy the GPL.

As already stated, whether the GPL is satisfied or not is
rather irrelevant.

> That's what the GPL and copyright
> work combine together to do. You could, of course, negotiate a separate

Depends on "my code". I would have the right to disallow redistribution
of the program as full, or of a modified version of the program under GPL,
and this is exactly the point. I do not state any restrictions concerning
algorithms used in the program.

>> It is exactly that I do not want; I prefer a mechanism where one guy is
>> responsible for the lifetime of the project and controls the route of
>> the project. While I'm a firm believer of democracy, I do not believe

This is one of the implications of the GPL: There is no restriction
concerning "control" of the program.

> Your
> own license would prevent this from happening without your permission.
> For instance, the Windows port that's been underway wouldn't be legal
> without your approval.

You say it.

> From what I've seen, you appear to have encouraged
> this port, but that's beside the point -- hypothetically, if you'd been
> rabidly anti-Microsoft or arbitrary about it, you could have forbidden
> it, given the terms of your license.

You say it, and it's exactly why the licence looks like this: I want to have
an eye on the port, and in the purely hypothetical case that the port doesn't
perform not closely to the original work, and in the - again - hypothetical
case that the author of the port does not show any interest to fix it, nor
to help me fixing it, I want to have the right to say "No!". This is simply
because I don't want to end up in a situation where people imply bad
coding standards of the port to bad coding standards of the original. I
do not want to find myself in the situation where I've nothing to say about
modified versions of the program. I regard it as quite self-understanding
that a good cooperation will result in a good product, but why not just
write this as part of licencing requirement down? I don't think that anyone
who takes software development half-way serious could argue against it.

> Also hypothetically, if in the
> future somebody wanted to update the code for new OSs or new versions of
> current OSs, and if you couldn't be contacted for any reason, those
> potential future developers would be out of luck; your license locks your
> code off for anybody who can't contact you.

Yes, indeed. This implies that I'd had to hand out the licence to
someone else to take over the work once I won't be able to invest any
time in it. I call this "responsibility" for the code: It must be clear
who maintains what. I take this serious, though: I recently handed out
my complete Amiga software collection, around 30 programs or so, under
similar licencing conditions.

> Please note that I'm not trying to get into the "my-license-is-better-
> than-your-license" shouting match; I'm just trying to point out some of
> the implications of your license that you appear not to have recognized,

I did. That's why they are there.

Greetings,
Thomas

> errors?

Interestingly, Perry didn't tell you what this code does and how it is used.
Funny, isn't it? Whereas David's code used a modeline-based approach, this
code doesn't. Whereas David's code AFAIK used direct color mapping within
Antic, this code generates color-lookup indices for GTIA. Whereas David
had to use special code in GTIA to keep care of antic Hi-Res modes, this
is taken care of specialized LUTs right away here since Perry didn't
show you even the contents of the LUTs, did he? Hence, the LUTs
are not even identical. Whereas David's code has to figure out alignment
restrictions of the architecture, buffers are always aligned within my
code as horizontal scrolling is taken care of within GTIA. What you seem
to think of "errors" is handled in code that is not part of what Perry
quoted, and what Perry quoted is part of a simple LUT based scan-line
specialized build-up class. I do not deny that I read this part of David's
code, of course I did. Do you think using similar LUTs puts the program
under GPL? Do you think reading a program puts another program under GPL
because the author found an idea useful?

> Look, I don't think anyone on the A8 side was all worked up over this since
> 90% of the code is new, or at least rewritten enough not to be recognizable,

> with any of the A8 developers given the examples Perry showed them, and your
> attack on the GPL has reminded them of their rights that you trampled.

And, as said again, this is simply not the case. David's LUTs solve the
problem adequately. I don't think using a similar construction by generating
individual pixels by means of bit-based lookup-tables is related.

> You have a very strange idea of what is "free code". Your license takes away
> the right to modify your code which by definition renders it non-free.

Do you have to pay for it? Do I hide it? Do I hide ideas from you? Unlike
GPL, I do not make the attempt to force anyone else into playing by the
same licence.

> The
> code isn't "public" just because you released the source,

This is what I understand under "public".

> nor is it "free"

There's nothing to believe. You just have it in front of your eyes,
case proven!

> Thats what Microsoft claimed when they tried to convince people the
> GPL was evil, but no one bought it, so they switched tactics. I suggest you
> switch tactics too.

I stay to what I claimed. Indeed, this whole discussion just shows what is
so evil on the GPL: I did just read old code years ago, wrote code that to
a minor extend uses a similar technique though used for a somewhat different
purpose, and now I've to fight with language lawyers whether this is a
GPL violation. *I DO NOT WANT THIS*, and I do not want anyone else to go
thru a fight.

> Are you going to throw all that good code away because you can't control it
> exactly the way you want?

If that is the only solution, yes.

> You've already written 90% of it, why not finish

I can hardly argue against it. (-; I've two of them at home. Unfortunately, the
disk drives become a problem nowadays, and getting proper disks for them
is also getting harder. About the "buggy" part we've to talk again, though.

So long,
Thomas

Everything I know about copyright law suggests you're wrong. I'm a
professional computer book author, so I have some familiarity with
copyright law, particularly in the US, although I'm not a copyright
lawyer. Your license is a legal document, and so must use the language of
legal documents; "oh, I didn't mean it that way" won't fly in court.

If it were 100% your own code, sure. That's what's under debate, though;
the claim is that it's *NOT* 100% your code.

>>> It leaves the design of a project to someone who has the

> concerning "control" of the program.

That depends on what you mean. You can retain control of your own branch
of the project. Nothing in the GPL says that you must accept patches
submitted by others. You can ignore them if you see fit. You can accept
them but make your own changes. You could probably even post them online
along with a detailed description of why you think they're bad, but not
use them in your project. In practice, this means that chances are your

version will be the only version in wide distribution, since if you do a good job maintaining the code, nobody will see the need to fork the code. If somebody else wants to, though, the GPL does allow another person to fork the code and create another project from it. That project might or might not succeed. The GPL also allows people to distribute minor changes, as for instance might be required to compile the program on a new compiler or for a specific OS. If you don't want to permit such changes, I understand and respect that, but please don't misrepresent the GPL by saying it gives control of the project to the last patch submitter; it doesn't.

Incidentally, you may want to look at the license used by Dan Bernstein for qmail (http://www.qmail.org) and other programs. It's been a while since I read it, but IIRC, it's basically the GPL with a no-unauthorized-binary-distribution clause tacked on. Bernstein's reasons for doing this are similar to your stated reasons for using your license -- he wants to prevent the distribution of qmail binaries that have been modified without his permission.

I understand and respect your reasoning, but there is a flip side: A potential developer doesn't know your standards for acceptance. You could arbitrarily withhold permission to use the code. That makes the code non-free in a very fundamental way, just as you say the GPL is non-free in a very fundamental way. They're different fundamental ways, of course.

>> Also hypothetically, if in the
>> future somebody wanted to update the code for new OSs or new versions of

It's not just about your own responsibility, although that's part of it. Suppose your e-mail address changes and you change the name of the program. Somebody might come across an old archive and then be unable to locate you based on the information in the archive. You might be perfectly responsible in terms of keeping the code up to date, but still be effectively unreachable. Then there are the things that are horrible to contemplate, but that you should. For instance, what if you're in an auto accident and end up in a coma for ten years? What if you die? Who has control of the code then? Perhaps you've made provisions for such eventualities in a will or a living will, but the license doesn't mention them. If you haven't made provisions, then presumably your code will become part of your estate, and might go to a spouse, a child, a parent, or the state. Whoever gets it might not care, or might not even know what they've got or what it means to maintain it. Your code would then slowly become unuseable, protected by copyright and its own licensing restrictions.

Ok, so when Microsoft goes out and steals the code to the Linux kernel or
Apache webserver, I suppose that won't matter, either?

I have to say that I am _APPAULED_ by the response here on c.s.a.8.
I've been on this newsgroup for at least 12 years, and I must say, I had no
idea how many foul-mouthed, disrespectful, unappreciative people were out
here.

There's legal precedent counter to your claim. Namely, the BSDs are
derived from 100%, file-by-file rewrites of the original AT&T UNIX source
code. Thomas certainly has a right to release his own code under any
license he likes, including anything that's a drop-in replacement for
allegedly infringing code.

Again, though, I am not a lawyer; this is my lay interpretation. If this
thing can't be resolved amicably and Thomas wants to re-release Atari++,
lawyers must be consulted.

It would matter, but it won't require a GPL to avoid this. In fact, the
common copyright laws would be sufficient as I would believe.

Besides, Microsoft using a Linux kernel would definitely be an improvement,
wouldn't it? (-;

So long,

It does enough in the sense that work can be derived from it without
the necessity to consult the author, which is one of the problems. I'm
the last who wants to avoid porting it to more platforms. In fact, I
tried to design it in a way to make this easy (autoconf and all the other
nifties are used and compilation has been tested on the architectures
I could get hands on). Let's just state this as a fact: I would prefer
to have a word in this. See also below.

In principle, yes. However, something like that has to happen if you want
to keep the quality high. If you cannot reject anything, you'll end up with
a mixture of various design paradigms that might be rather hard to maintain
in the long-term; I would even say that this is one of the more common
problems of GPL'd programs. I think it is a good idea before working on
a program to stick the heads together: Get in contact with the author, ask
him about his intention, then try to work close in these lines to keep a
consistent design. That's what I'm asking for.

> That makes the code
> non-free in a very fundamental way, just as you say the GPL is non-free in

Now, seriously: Do you really think that this is an important issue with
code as un-important as this? If I'd had a rather important piece of
software, then this would be developed in a company with a development
team and the company holding the licence on it, but that's truly not the
case (on this software, I mean). What we have here is just a
spare-time by-product. Should it evolve to something very serious - which
I really have some doubts in - then we might discuss this issue again.

So long,
Thomas

> left? Is there a point at which I've replaced so many lines that it isn't
> "the program" any more? If so, when?

This is then exactly what the court has to find out. I cannot and want not
to give a precise definition. It is as much as asking at which age you
can legally call a men "old". The answer is "it depends".

> If I modify your program into an
> elevator controller, is it the same program?

In my understanding, no.

> What if I modify it into
> something more similar to the original program?

Define similar. If, for example, you write another emulator and take
the CPU emulation out, then this is no longer "the program". If you
write an Atari emulator, and take the CPU emulation from me, it is
no longer "the program". If you take the title and write your name
instead of mine, it is a modification.

> How similar does the function
> have to be before it is considered to be "the program"?

It pretty much depends. You can never give 100% precise definitions
in legal terms. It is the matter of the court whether the facts
is serious enough to touch the mentioned restrictions.

>>Depends on "my code". I would have the right to disallow redistribution
>>of the program as full, or of a modified version of the program under GPL,
>>and this is exactly the point. I do not state any restrictions concerning
>>algorithms used in the program.

> The problem isn't algorithms, it's use of code. Your license doesn't prohibit

> BRILLIANT. >:^(

I'm turning something "against the atari800" by shutting "my code down"?
Excuse me? I posted my opinion here. Is that your "freedom of speech"?

> I'm sorry if I'm so pissy lately, but after all of the hard work that
> the Atari800 developers did, and released for free (not just
> "free as in beer", but "free as in speech", as they say),

Now, where have I forbidden anyone to speak?

> all I've seen is animosity against them over their standing up for their
> _rights!_

And that implies that I've none. Either, I've to swallow it because
someone blaims that "code has been stolen instead of algorithms" and
invested all *my* work - and that it is - for nothing, or for publishing
it under conditions I did not intend. I do not see that I'm asking for
too much, but aparently you'd prefer to fight an ideological war. Count me
out on this, that's not worth it. That's also why I shut the project down
for the time, and that also answers all the above questions: It is not
worth to discuss software development with people that rather prefer to
insist on their politics than on the problem at hand. This is also exactly
the reason why I dislike the GPL. It implies a certain ideology and
disallows you to share a different opinion. As soon as you read a line
of GPL code, you're DOOMED. If that's your freedom, go for it, but please
leave me alone.

> <snip>
>> For instance, the Windows port that's been underway wouldn't be legal
>> without your approval. From what I've seen, you appear to have encouraged
>> this port, but that's beside the point -- hypothetically, if you'd been
>> rabidly anti-Microsoft or arbitrary about it, you could have forbidden
>> it, given the terms of your license.
> <snip>

> And that's not what the Atari800 developers had in mind when they chose
> the GPL to _begin with!_

And that's not what I had in mind either. So? In fact, I'm quite
arbitrary about a MS port as in "I wouldn't care if one existed, neither
would I care if it didn't, but I can't write one in first place, so it's
not in my hands". I don't own Windows, neither a compiler for it. But,
since someone asked about it, wanting to do it, why should I stop him?

The people must be open minded, and I'm heavily trying to. Trying to
enforce a certain thinking of a licence is cheating. It implies that
while I write software, I'm also doing politics. And *that* I DO NOT LIKE.

So long,
Thomas

> Your license says "you can't take the code at all". Your license is more
> restrictive than the GPL--the GPL puts limits on how the GPL code can be
> reused, but your code can't be reused at all!

No, that's not true. It says "Please ask before you take the code". Quite
something different. Please don't cite me wrong.

>>I stay to what I claimed. Indeed, this whole discussion just shows what is
>>so evil on the GPL: I did just read old code years ago, wrote code that to
>>a minor extend uses a similar technique though used for a somewhat different
>>purpose, and now I've to fight with language lawyers whether this is a

> of the GPL license.

And again, that's not true. If someone takes the code without contacting
me, then yes. Writing a mail is not asking for much.

> Except that it's a violation of your license to use
> your code at all, while it's only a violation of the GPL to use their code
> without obeying their requirements.

Same here. I've the requirement of getting asked.

>>> than let others work on and improve your creation?
>>I won't feed the virus, that much for sure.

> So why not release it with a BSD license?

In fact, we're trying to work exactly this out. I hope we're getting
the issues resolved in a couple of days in a sense of a cross-licencing
agreement. I'm willing to swallow the BSD licence to end this drivel and
to continue with the development, as this is what matters. And not
politics.

Greetings,
Thomas

> lawyers must be consulted.

In principle yes, but none is willing to go that far. Not for that, as I rather regard all this as a rather strange discussion to begin with. I do not intend to take the rights from anyone; the intention was to provide a good program, and to keep it as good. It seems too much ideology is involved here, and too much to make me feel comfortable. We're working on a cross-licencing resolution for the problem which helps both sides, then shut down the ideological discussion and return to a technical level, where I prefer to work.

Desipite, I thank you for your clear and unbiased posts.

Greetings,
Thomas

You are completly wrong. You don't need to accept any patches in GPL project.
You don't need to answer single mail from any developer. You don't need to do
ANYTHING like that. You can write all project yourself without looking on
anyone else. GPL just mean - other person can get your code, and change it. It
doesn't affect your code, on your hard disk and on your website.

Please just *read* GPL.

Actually it is my understanding that they did steal/borrow some code to get more of an internet presence. Way I heard the story was Gates was more or less unaware of the internet and Outlook Express and Internet Explorer were rogue project done by some MS programmers. I believe there is even a blurb giving Mozilla credit for the original core of IE.

It's the same stuff that has been going on for years, just use a word processor to change the text from "copyright" and "piracy" to "GPL". Intellectual property rights anyway, been a hot topic since someone figured out how to rub two sticks together to make fire.

Just a matter of fact that the warez types are shall we say, more free with a phrase. I don't think they mean anything serious by it, just the way they express themselves.

Don'y know about specific site for everything.

Try prying up all of the chips a little, carefully, then reseat. If you don't know how to take apart and use static care, don't do it.

Since its doing something, The CPU is probably o.k. Pokey is first to handle keyboard and disk/tape data I/o. I'd start there.

Rick D.

Howdy,

here is my take on this:

1) Thomas Richter took an old version of the atari800 codebase which
was generously provided by the developers, rewrote parts of it, added
a lot of code to it, and turned it into his own Atari++ product.
2) Thomas Richter distributes Atari++ under a restrictive license,
which clearly is an illegal copyright infringement, punishable in most
countries around the world.
3) The original atari800 developers notice this and try to resolve the
situation in a nice and gentleman-like fashion.
4) Things get out of hand, and Thomas Richter shuts the Atari++ web
site down, probably in an attempt to hide the fact that his code is
very similar to the original atari800 code.

Point 1) has already been acknowledged several times by Thomas
Richter, altough he tries to talk his way around it by turning
attention away from the matter. His blatant ignorance of copyright law
is evident from his postings. Despite unbiased comments and highly
relevant links to appropriate web sites, he does not seem to try to
improve his understanding of the matter.

Thomas Richter has repetedly accused the atari800 developers of being
"restrictive" when they have released their code under the (admittedly
quite restrictive) GPL. Many of us lurkers find this quite amusing,
since he released his own code under a license which is quite a lot
more restrictive than the GPL. His aggrevated emotions seem to cloud
his judgement and senses, making it hard for him to see how childish
he seems to the rest of us.

People have suggested many ways to resolve this situation, ranging
from Thomas rewriting the parts of the code that originally was
written by the atari800 developers, to going to court and let laywers
settle the matter. Of course, if Thomas would release his code under
the GPL, this would be resolved.

For the benefit of those of you who are interested of copyright
violations and the GPL, here are a few links:

You're a bit wrong here. Atari800 1.2.9 (unreleased yet, in CVS only) does have
pixel-exact emulation of Antic already.

Still, I prefer if the atari++ continues to exist and evolve. It was never
my intent to shut it down. But I am sure you know it already.

Petr

> that clearly won't be a problem.

Legal language tends to be very precise, and so if you want to keep this
distinction, you need to develop some precise criterion for what
constitutes an acceptable level of use of your code in another product.
Creating this language would probably be very tricky. An error could have
unintended consequences. Thus, between my not knowing precisely what you
mean and my own lack of legal credentials, I'm not going to suggest any
specific changes. I suggest you consult an intellectual property attorney
to help you if this point is important to you.

>>> You say it.
>
>> So do you, below.
>

Ah, I see. In this sort of context (namely, an exchange that's become
somewhat heated and confrontational), the phrase "you said it" is
typically shorthand for "you said it, not me" -- in other words,
disagreement.

>> I understand and respect your reasoning, but there is a flip side: A
>> potential developer doesn't know your standards for acceptance. You could

>
> In principle, yes. However, something like that has to happen if you want
> to keep the quality high.

In which case, the code isn't free, in either the FSF/GPL sense of free or
the BSD sense. You control it -- tightly. Your license more closely
resembles Microsoft's "shared source" than anything in the open source

community. You certainly have a right to do this, but please understand
that doing this and then claiming your goals are similar to those of open
source developers *WILL* rub some people the wrong way.

> If you cannot reject anything, you'll end up with
> a mixture of various design paradigms that might be rather hard to maintain
> in the long-term;

Again with the "cannot reject" fallacy. As project initiator and primary
code maintainer, you **CAN** reject code. A rejectee can then use your
code in his/her own fork, but chances are that fork won't gain popularity,
assuming you keep your own fork up to date, etc.

> I would even say that this is one of the more common

You can get that using the GPL, the BSD license, or any other open source
license; just lay that out as the ground rules for anybody who wants to
submit code. Those who want to contribute and play by those rules will do
so. Those who want to do something you don't like either won't bother or
will fork the code and start a new project. You'll still have control over
your fork. I'm not positive, but some licenses may even include provisions
that would require the other project to use a different name in this
situation.

>
> Now, seriously: Do you really think that this is an important issue with
> code as un-important as this?

If the project is important enough to you that you've put those
restrictions in your license, then it should be important enough to you
to consider the continued viability of your work in the future. Also,
remember that your code could potentially be used in other projects that
might be more important. For instance, maybe somebody would need to
emulate a 6502 for some medical device that uses software originally
written for an earlier-generation medical device. This use would be
impossible with your current license should you be unreachable.

The core of this debate, Thomas, and please forgive me for using some extremely blunt language, is whether you plagiarized others' work. You claim innocence and the other side claims guilt. To my eyes, postings of evidence to date seem suspicious but inconclusive. Your explanations of your license suggest you have some odd notions of what constitutes derivative work, so it's quite possible you did in fact plagiarize something without realizing that was what you were doing. I've posted two earlier messages suggesting a third-party audit to resolve the question, with no response from either side to that suggestion.

As to the "ideological war," I'm afraid that you fired the first shot of that one, Thomas, with your diatribes against the GPL in your second posting to this thread.

> The people must be open minded, and I'm heavily trying to. Trying to
> enforce a certain thinking of a licence is cheating. It implies that
> while I write software, I'm also doing politics. And *that* I DO NOT LIKE.

Consider this a life lesson, then: You ****MUST***** consider such issues when you deal with so-called intellectual property. If you don't like it, then either buckle down and deal with it despite your dislike or don't work in that field. Complaining about it won't do you any good. Also consider yourself lucky: An allegation of code theft from some others could have landed you in much worse trouble than a tongue-lashing on a Usenet newsgroup.

If there were a lot of Atari dealers posting ads like Ben does things
would be very different... However, as he is actually one of very few
left his posts simply are no problem. They do not add to the bandwith and
there is no charter for comp.sys.atari.st that prohibits adverts (I don't
know about the other groups this goes to).

>tactics with bizarro stories about things I could give a whit about and
>how people should take pity on him and patronize him? It's just not

Professional or not is not an issue. There are lots of other posts here
that are not professional at all. But, in a sence you are right. If i
were Ben i would not post the very same text several times. Instead I
would post short messages whenever I had something new to tell, like
"New catalogue out" or "several TT graphics cards in stock" with a link
to his website.

>>Some might think twice before sending cash in advance to remote

>Who on earth would send hard currency thru the mail?! That's not a good
>idea for eBay. Much less an "Internet Business". Hell, it's not even a
>smart idea for people who know each other.

What are you talking about?? Why would that be insecure??

I have actually sent huge amounts of money abroad in exactly the same way in my job some years ago. SEK 200000 ($25000) in each parcel and a couple of these parcels a day using nothing but the standard post office services and local armoured transports. Later on the Post only allowed max SEK 50000 in each parcel so we now use other ways to get the bank notes to there destinations.

To just send a minor amount of bank notes only costs appr. $6 here and everything is insured all the way until Ben himself has the envelope in his own hands.

I think we all can agree to that Ben Smith can be trusted 100% and not simply keep the money without delivering the goods! So, this is simply a 99.9999...% secure way of sending money to any country. And all perfectly legal of course...

I'm not sure how the original Mosaic browser (which Netscape and IE were
based on) was licensed. It certainly wasn't GPL. Probably more like BSD.

(BSD allows use and change without returning code back to the community...
that's how Apple's using the Mach BSD kernel.)

The real problem with intellectual property is that it is dealing with
abstract ideas. i.e. it does not really exist. These days every piece of
software comes with a complex license -> largely driven by the American
legalistic society. That country is so far some free its untrue. Not that
things are much better here:-(

Anyway getting OT now!

Idiots.

Your opinion is as irrelevent as mine. We're users, not the developers. They're the ones who put their time, effort, blood, sweat and tears into A8 and A++, thats why this is so important to them, and why you fail to understand that. What do you care? You'll go on playing whatever is available no matter who creates it, the source code and its license mean nothing to you, you just want to use it, and thats fine, but if you can't be polite to the people WHO MADE YOUR RECREATIONAL ENTERTAINMENT POSSIBLE, then just SHUT UP.

I posted Perry's comments to gnu.misc.discuss, and the respondents said there is enough "evidence" there to make a case of a GPL violation. Of course they aren't lawyers and neither am I, so we won't know anything for sure unless some A8 develepers who found their code in A+ decide to act, possibly by getting help from the FSF.

Firstly they clearly aren't doing this as some sweeping gesture to the A8 community as you insist - this seems more about personal aggrandisement and self gratification of the programmers involved. Pulling a project rather than quietly settling a difference over a code segment and then trying to pretend it's the principal of the thing? Quoting Linux etc? Exactly how does that serve the A8 community..?

Secondly we all have the right to an opinion here including you and me, don't forget it kid.

I use real Ataris and I have a heck of a lot of original software so I did support the original programmers. I also support and like the output of Steven Tucker et all and when it's available I'll be in the queue for one of Mathy's 1Mb upgrades. However I'm not interested in a bunch of drama-queens getting shirty over their PC-based emulations of Atari hardware.

Also you have no idea what software I write or don't write in the public domain, don't assume.

# 855. ADV: Atari Sales, Service & Support: Bravo Sierra!

Pardon any delay in service as my friend died. I'm just now catching up.
I've updated 6 of my 8 Catalogs, all 8 Bit and ST. Adding many new items!
Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari
Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari
Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods!
So not only do I sell NEW Atari Goods at a competitive price, I also sell
used Atari Goods you may not be able to find anymore at Swap Meets, Thrift
Stores or even Auctions Sites! And I sell for less! And unlike those who
will remain anonymous! I test Goods before I sell them. I can afford to
sell for less because I keep overhead down, I avoid going into debt and I
avoid making promises I can't keep! This includes not offering services
that I cant follow up with! So not only can I sell you some Great New
stuff! But I can sell you hard to find 2nd Hand Goods, partly because
I'm the guy most people come to when they want to give their Ataris a New/
Good Home! So I'm involved in saving Orphaned Atari's from Atari Heaven!
Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org

> Do you have to pay for it?

Possibly, your license requires your "permission" and that could even include a monetary fee given to you before you give permission. You may not have ever intended to do that, but your license leaves this possibility open.

> Do I hide it?

This is what I was trying to get at when I said just releasing the source code doesn't make it free. Yes, Thomas, its still "hidden" even though you've released the source code. Its still hidden because of the restrictive license you put on it.

> Do I hide ideas from you?

This isn't about ideas Thomas, its about lines of code, including ones with the same comments and data tables with the same errors.

As for the license in general though, who gets to decide what an "idea" is versus what a "substantial part of the code" is? You? How many lines of code can be borrowed before it stops being just the borrowing of an idea, or the borrowing of an algorithym, to what you perceive as the "theft" of your code? This whole issue is already complicated enough, but your license is so vague it turns the ground into a minefield. But most important of all, your license requires your blessing before anyone can do anything with your code, whether they want to use just 10 lines or a 1000, and that is an additional arbitrary restriction the GPL does not have. As long as you insist on maintaining that high a level of control over the code, it is not free in any sense of the word. Whatever you may have intended, Thomas, your code is not free, and your license is not open, period.

> Unlike GPL, I do not make the attempt to force anyone else into playing by
> the same licence.

The GPL does not force you either. If you don't like the GPL's requirements then don't use GPL'd code. The problem is Thomas, the use of GPL'd code is exactly what people believe you have done.

# 857. Re: atari++ shut down for legal reasons

Hi,

> 1) Thomas Richter took an old version of the atari800 codebase which
> was generously provided by the developers, rewrote parts of it, added
> a lot of code to it, and turned it into his own Atari++ product.

Even by Bill's definition, these "parts" are over 90% of the code. By
my POV, these are 100%.

> 2) Thomas Richter distributes Atari++ under a restrictive license,
> which clearly is an illegal copyright infringement, punishable in most
> countries around the world.

It is a copyright infringment provided you can prove that old code has
been used. It is not otherwise. Unless this item is resolved, no such
claims can be made on a legal ground.

> 3) The original atari800 developers notice this and try to resolve the
> situation in a nice and gentleman-like fashion.

So do I.

> 4) Things get out of hand, and Thomas Richter shuts the Atari++ web
> site down, probably in an attempt to hide the fact that his code is
> very similar to the original atari800 code.

No. In an attempt to avoid a legal issue until items get resolved; it
is not worth the trouble to go a legal affair just for a hobby project.
If I ever had tried to hide code, I wouldn't have been silly enough to
make code available for download in first place. I was and still am
believing that no GPL licences apply, but it is better to get the
issue resolved this way than taking it to court.

> Point 1) has already been acknowledged several times by Thomas
> Richter, altough he tries to talk his way around it by turning
> attention away from the matter. His blatant ignorance of copyright law
> is evident from his postings.

Which is not quite true. You blame me to ignore copyrights without
having a proper ground to prove this.

> Despite unbiased comments and highly
> relevant links to appropriate web sites, he does not seem to try to
> improve his understanding of the matter.

Get yourself informed, please.

> Thomas Richter has repetedly accused the atari800 developers of being
> "restrictive" when they have released their code under the (admittedly
> quite restrictive) GPL.

I haven't accused atari800 of having released their code the way they
did. I'm not responsible for the licence politics of other projects,
clearly. I wouldn't have made that choice in first place, but this
I cannot influence and I've no saying in that as it is not my code to
begin with. All I'm saying is that for me the GPL is too restrictive
in first place.

> Many of us lurkers find this quite amusing,
> since he released his own code under a license which is quite a lot
> more restrictive than the GPL. His aggrevated emotions seem to cloud
> his judgement and senses, making it hard for him to see how childish
> he seems to the rest of us.

The childish part seems to be that I don't think that any considerable
restrictions arise of the licence except that you might have to ask me,
but aparently, some people seem to find that this is asking for too much.
While I can clearly accept this opinion, I do share it for reasons laid
down here.

> People have suggested many ways to resolve this situation, ranging
> from Thomas rewriting the parts of the code that originally was
> written by the atari800 developers,

Which I would have agreed upon. Do you want to imply that I wouldn't?
This is simply not true, please read my follow ups. "Would" because
I think we're approaching another solution.

> to going to court and let laywers
> settle the matter.

Which seem childish for me in first place. At least, it's a waste of
money for a project that is nothing more than a spare-time project.

> Of course, if Thomas would release his code under
> the GPL, this would be resolved.

Which, as said, is unacceptable for me for reasons I gave. You might
not want to follow my reasoning, but as I've a saying concering my
projects, please leave this decision for me.

So long,
Thomas

Thomas, you really need to read up on what the GPL really does and does not
do, because the irony here is that you don't need to cross-license your code
to "keep it good", you can do that just as well under the GPL.

No, Debian considers qmail to be non-free. You can't sneak past the problem
by tacking on a restrictive clause to the GPL. When you add that clause, its
no longer the GPL. :)

Homepak, I had it. Word processor, database and comm program. The wp
and db were functional but very limited as I remember. Hometerm was a
decent terminal program, but not as good as 1030 Express.

For me it was PaperClip, Synfile, Syncalc and 1030 Express.

I afraid you haven't understood fully. It requires permission for code
modifications. Not for usage.

>> Do I hide it?

> This is what I was trying to get at when I said just releasing the source code
> doesn't make it free. Yes, Thomas, its still "hidden" even though you've
> released the source code. Its still hidden because of the restrictive license
> you put on it.

You have a strange idea of "hiding" things. I would hide it if I had released
binaries only. In that sense of the word, even publishing a book would be
"hiding" since you don't allow the reader to re-publish an edited version of
it. I'd really like to see the author that allows readers to do so without
at least contacting the author about it. (-;

>> Do I hide ideas from you?

> This isn't about ideas Thomas, its about lines of code, including ones with
> the same comments and data tables with the same errors.

Sure the tables are the same - they generate the same graphics and for
that reason, they have to. There are actually no "errors" in here.

> As for the license in general though, who gets to decide what an "idea" is
> versus what a "substantial part of the code" is? You? How many lines of code
> can be borrowed before it stops being just the borrowing of an idea, or the
> borrowing of an algorithym, to what you perceive as the "theft" of your code?

A question that cannot be answered in full generality. In case of
doubt, a court would have to answer this question. I think that I
borrowed the idea of generating Antic graphics from the old Atari code
I worked on years ago, and I never tried to deny this fact. In fact,
if Bill would have posted the generation mechanism for a different
Antic mode, e.g. for Antic 6 or 7, the code would have looked more
different because I had another idea here how to perform better. The
point is here that there is not much of a chance to generate the same
numbers differently efficently. This is not a super-complicated
compression algorithm, it is just a table- lookup and pixel-fill-in of
about five lines. With about the same arguing, I could state that any

usage of the algorithm below to compute an integer approximation of
the square root

```
unsigned long long sqrtint(unsigned long long n)
{
long long q = 0;
long long z = 0;
long long w = 1;
long long t;
int i;

for(i=0;i<((BITS_IN_LONG_LONG)>>1);i++) {
q <<= 2;
w = (w<<1) - 1;

/* 128 bit left shift of the z,n register */
z <<= 1;
if ((long long)n<0) z |= 1;
n <<= 1;
z <<= 1;
if ((long long)n<0) z |= 1;
n <<= 1;

t = q + w;
if (t <= z) {
w += 2;
q = t;
}
}

return (w-1) >> 1;
}
```

is a copyright violation, though I'm pretty sure someone else has
been "equaly smart". You cannot effectively compute a square root by
integer mathematics without using an algorithm going along the same lines
as the above. There is simply not much choice here. So isn't with Antic
Video modes: You have to shift bits around efficently, and that works best
by LUTs. Since the original position of bits is specified, and so is their
target position, the look-and-feel of the tables is obvious. Even more,
the table contents is likely to be different since might use a different
method how to feed the GTIA module, or use different indices here. If
you'd had a closer look at the how-and-why, you'd see that the data in
my antic implementation follows quite different routes than those in
the original. For more complicated antic modes, the algorithm also
performs differently, e.g. for modes 6 and 7, and also for modes 2 and 3.

> This whole issue is already complicated enough, but your license is so vague
> it turns the ground into a minefield. But most important of all, your license
> requires your blessing before anyone can do anything with your code, whether
> they want to use just 10 lines or a 1000, and that is an additional arbitrary
> restriction the GPL does not have.

GPL, however, has a different restriction. Which proves what? In the strict sense of the word, the licences are incompatible. They are because I wanted them to be incompatible in first place. Your implication/opinion is that one must be better than the other. I have another opinion about it.

> As long as you insist on maintaining that
> high a level of control over the code, it is not free in any sense of the
> word.

A defintion of "free" I cannot follow, but that's again an opinion.

> Whatever you may have intended, Thomas, your code is not free, and your
> license is not open, period.

It is not "free" in the GPL sense, and not "open" in the GPL sense. Though I insist(!) that it is open enough for the purposes intended, and so it is for the "free" word. I do not agree that the kind of "freedom" GPL offers is the right thing to do, nor would I call the enforcement to licence derived work under GPL a "freedom" as it restricts choices of the author, but then that's my opinion. You can hardly argue about opinions.

>> Unlike GPL, I do not make the attempt to force anyone else into playing by
>> the same licence.

> The GPL does not force you either.

But of course it does! It requires derived work to be under GPL.

> If you don't like the GPL's requirements
> then don't use GPL'd code. The problem is Thomas, the use of GPL'd code is
> exactly what people believe you have done.

And, as said, I do not follow this argumentation.

Whatever this is, I think we found a suitable solution for all this. I'll switch to another licence (some BSD lookalike) with a cross-licencing agreement. If anyone is happy with this solution, then so might it be.

So long,
Thomas

Look, Ed, there are two major reasons why I didn't start with the GPL
in first place. One reason is that I wanted full control of the source;
as said, I had best intentions about this "restriction" to keep the code
in a good shape. I have never had the intention to hide anything from
anyone. The second reason is the "derived works" clause of GPL
I have an aversion against. I don't want you to share my POV, of course,
but then, we need to find a solution that fits both sides well. I give
up the "control clause" as this seems to be the major point of critique,
and atari800 authors in return "lessen" (in the sense of GPL) the licence
on those code parts that they believe are inflicted in the licence
violation. If both sides can deal with that, then we let it go.

Furthermore, I believe that it is better for the future development of
both products to have a code exchange (CPU cycle based emulation and
the OO design plus the user menu from my side, for example, maybe parts
of the cart emulation on the other side). Since we have a different licence
basis and a different opinion how the licence should look like, we must
find another solution. I think the solution sounds reasonable, and I can
live with it. The only question that concerns me whether there is a legal
sensitive way to formulate all this in a half-way waterproof way, as I'd
like to resume development ASAP without going thru a discussion as this.

So long,
Thomas

I am afraid that the key atari800 authors are not accessible (David, Ron) unfortunately so there is nobody that could "lessen" the license in return. I would like you to actually release those modules we talked about (Antic, Pokey and the RT8 cartridge) with the original GPL copyright notice. For the rest of the code the Modified BSD would do perfectly, I believe.

Petr

> believe.

Bizarre, bizarre. As for antic, I'm offering another way out, namely
to come up with a different algorithm. I'm willing to post the
modifications as soon as they're done in some way or another,
but that'll take a week or so. I leave it to someone to decide whether the
modifications are sufficient or not to release it as BSD. As for the
sound, I have to think about. I do not really believe there's really a better
or more suitable way of generating pokey output than the way it's done now,
and if that is the case, then you hardly can write any Atari emulator without
GPL. I'm then wondering how any commercial emulator would be legal, though.

Would this, as far as antic is concerned, be acceptable?

A third solution I could offer is to allow re-distribution of the source
as GPL provided the original work doesn't get GPL. I wouldn't care about
this part of the project, but continue with the main or then side branch
under a non-GPL licencing model.

A forth solution we could find would be to use a licence similar to the
Alladin licencing model where the head branch remains licenced under a
"more restricted" licence, but I guarantee by that licence that the stable
branches become GPL after a suitable amount of time. (Two months seems to be
a suitable offer concerning the current development pace). This way, I
had enough backing time to ensure the code quality I want, at least, and
what would be released would be considered stable enough. The problem that
I've here is that this would require to put derived products under GPL which
exactly what I do not want, but at least it keeps a certain buffer between
released products and the development branch.

After all, I have to think about this. Let me know your opinion.

Greetings,
Thomas

I never said it was the GPL; I was it was a MODIFIED GPL. As you hint,
the modification does make Bernstein's license a non-open-source license,
but then, so is Thomas's license. I only brought it up as something
Thomas might want to look at as an alternative to his license, which IMHO
has a lot of problems, even aside from the question of whether he used
Atari800 code in his emulator. As a general rule, IMHO it's best that
amateurs not try to write software licenses or other legal documents.
There are lots of examples of both open source and non-open-source
licenses that have been written by lawyers who know how to do such
things. Better to use such a license than to try to re-invent the wheel,
as it were.

Source record: 23585

Nobody cares about what license you use for your own work, you are entirely free to do whatever you choose. However, would you please explain the correspondences that have been identified between the code you assert you've rewritten and the original GPL'ed code?

If you copied in GPL code, then reworked it to some degree to fit in with your system (maybe even improving it on the way), then you have indeed contaminated your software with the GPL. This is the cost of using GPL code- you can't just take it, modify it and then release it under more restrictive terms. You should consider yourself lucky that the authors of the code you used are as civil as they have been.

When you use another's code, even as something to modify so it suits your project, you do not have the luxury of not caring about the licences, just as you don't have the luxury of not caring about taxes. It seems silly to play around with licenses when the solution to the problem is technical, not legal.

To a programmer, the two are identical. If you didn't want people to
modify your code, better for you to have released it in binary form only.

Part of the point of a software license is to keep the courts out of it
by laying down clear ground rules for use of the product. You've said you
want to keep laywers and courts out of the picture, too; but under many
scenarios, your license either prevents people from using (that is,
modifying or distributing) your code or is bait for a lawsuit. I've gone
into some of these in other messages -- what if you can't be contacted,
go into a coma, die, etc.? Somebody might risk releasing modifications
under those conditions, but I wouldn't -- the chance that you or your
heirs would turn up and sue my pants off would be too great. You might
now protest that you have no intention of doing that, but somebody
reading your code and license can't know that, and even you can't speak
for your heirs 70 years after you die.

> With about the same arguing, I could state that any
> usage of the algorithm below to compute an integer approximation of

[29 lines of code snipped for brevity]

> is a copyright violation, though I'm pretty sure someone else has
> been "equaly smart".

Usage of the algorithm would not be, but usage of the code that
implements it is. That line can be hard to see sometimes, particularly
for an extremely simple algorithm, and your posts have repeatedly failed
to acknowledge this important distinction. The algorithm expressed by
your 29 lines of code could certainly be expressed in other ways.

> You cannot effectively compute a square root by
> integer mathematics without using an algorithm going along the same lines
> as the above.

Perhaps, but this isn't about algorithms; it's about the implementation of
the algorithm. There are multiple ways to implement even a fairly simple
algorithm.

>> As long as you insist on maintaining that
>> high a level of control over the code, it is not free in any sense of the
>> word.
>
> A defintion of "free" I cannot follow, but that's again an opinion.

Your program is free in the sense of being without monetary cost. Many in
the open source community use the English word "free" as referring to
freedom to modify that source code and release those changes. Your code
is not free in that sense. Yes, your license says developers may contact
you for permission to use your code; *BUT THOSE CLAUSES DO NOT GRANT
USERS NEW RIGHTS*. A user may ALWAYS contact the owner of a program's
copyright (assuming that person is reachable) to ask for permission to
use the code. Thus, the license itself doesn't grant any freedoms in the
sense that most open source programmers care about. You personally might
be willing to grant rights on a case-by-case basis, but your license is
nothing special in this respect.

>>> Unlike GPL, I do not make the attempt to force anyone else into playing by
>>> the same licence.
>
>> The GPL does not force you either.
>
> But of course it does! It requires derived work to be under GPL.

Nobody's holding a gun to your head and forcing you to use a GPLed work as
the basis for yours. If you don't want to play by the GPL's rules, fine;
nobody is forcing you to do so. That doesn't mean you can base your code
on a GPLed work, though, any more than you could break into Microsoft HQ
and base your work on the Windows source code -- even if you change or
discard 90% of the original work's code.

The problem is that I do not really know. I haven't claimed that there
are correspondences between GPL code and mine. I have been told so.
Bill thinks that the a800 antic code and mine look too similar, as far
as I understand the picture. Maybe you shouldn't ask me about this.

The question is: Where does "take the code and modify it" start, and
where does "using an algorithm" ends.

> When you use another's code, even as something to modify so it suits
> your project, you do not have the luxury of not caring about the
> licences, just as you don't have the luxury of not caring about taxes.

But why do you take it for granted that I did?

> problem is technical, not legal.

Technical, in which sense? In the sense that I could resolve the problem
by offering a different code?

Greetings,
Thomas

# 875. Re: How about rewriting the 10% in dispute?

Newsgroup: comp.sys.atari.8bit

Hi Rod,

>> I afraid you haven't understood fully. It requires permission for code
>> modifications. Not for usage.

> To a programmer, the two are identical.

Well, but the intended audience is not the programmer. It is the end-
user. I admit that having to use a compiler to get the code running
doesn't make this a very end-user friendly product, but then it isn't
complete in first place either.

> If you didn't want people to
> modify your code, better for you to have released it in binary form only.

Well, possibly. I tried to be open and to have people look into the inside
as I've been quite positive that this is in the interest of the general
audience. The end-user wouldn't care, and the programmer might find it
interesting.

>>> As for the license in general though, who gets to decide what an "idea" is
>>> versus what a "substantial part of the code" is? You? How many lines of code
>>> can be borrowed before it stops being just the borrowing of an idea, or the
>>> borrowing of an algorithym, to what you perceive as the "theft" of your code?
>> A question that cannot be answered in full generality. In case of
>> doubt, a court would have to answer this question.

> Part of the point of a software license is to keep the courts out of it
> by laying down clear ground rules for use of the product. You've said you
> want to keep laywers and courts out of the picture, too; but under many

> modifying or distributing) your code or is bait for a lawsuit. I've gone
> into some of these in other messages -- what if you can't be contacted,
> go into a coma, die, etc.?

The funny part of this is that we just seem to have the problem with the
GPL code right away. David and Ron cannot be contacted anymore, at least
not right now, so the code remains under this licence. Question is whether
a resolution would be simpler if they could have been contacted.

> Somebody might risk releasing modifications
> under those conditions, but I wouldn't -- the chance that you or your
> heirs would turn up and sue my pants off would be too great. You might
> now protest that you have no intention of doing that, but somebody
> reading your code and license can't know that, and even you can't speak
> for your heirs 70 years after you die.

Ok, so let's put it like that: You've succesfully convinced me that
clarifications are, indeed, required.

>> With about the same arguing, I could state that any
>> usage of the algorithm below to compute an integer approximation of
>> the square root

> [29 lines of code snipped for brevity]

>> is a copyright violation, though I'm pretty sure someone else has
>> been "equaly smart".

> Usage of the algorithm would not be, but usage of the code that
> implements it is. That line can be hard to see sometimes, particularly
> for an extremely simple algorithm, and your posts have repeatedly failed
> to acknowledge this important distinction.

Not quite. We're now right at the point where I want to have you. (-;
Clearly, a distinction of an algorithm or a code cannot be drawn clearly.
Now, where does it start to be a modification, where does it end to be
an algorithm? Can this line be drawn clearly? I don't see that it can,
ever, even with a licence. So there always remains some doubt.

> The algorithm expressed by
> your 29 lines of code could certainly be expressed in other ways.

Certainly, but at which point would, provided the above had been
set under a licence, a copyright violation start and where would it
end?

>> You cannot effectively compute a square root by
>> integer mathematics without using an algorithm going along the same lines
>> as the above.

> Perhaps, but this isn't about algorithms; it's about the implementation of
> the algorithm. There are multiple ways to implement even a fairly simple
> algorithm.

Indeed.

>>> As long as you insist on maintaining that
>>> high a level of control over the code, it is not free in any sense of the
>>> word.
>>
>> A defintion of "free" I cannot follow, but that's again an opinion.

> Your program is free in the sense of being without monetary cost. Many in
> the open source community use the English word "free" as referring to
> freedom to modify that source code and release those changes. Your code
> is not free in that sense.

Agreed.

> Yes, your license says developers may contact
> you for permission to use your code; *BUT THOSE CLAUSES DO NOT GRANT
> USERS NEW RIGHTS*.

Again, this depends on the word "user". As said above, the target audience
is the user in the sense of the program user. But given the meaning of the
word you assign to it, then yes.

> A user may ALWAYS contact the owner of a program's
> copyright (assuming that person is reachable) to ask for permission to
> use the code. Thus, the license itself doesn't grant any freedoms in the
> sense that most open source programmers care about. You personally might
> be willing to grant rights on a case-by-case basis, but your license is
> nothing special in this respect.

Hmm, "special". No, maybe not, though what can you say in general? If
I want to have the freedom to possibly stop a port because it doesn't
fit the quality target, then some line must be drawn somewhere.

>>>> Unlike GPL, I do not make the attempt to force anyone else into playing by
>>>> the same licence.
>>
>>> The GPL does not force you either.
>>
>> But of course it does! It requires derived work to be under GPL.

> Nobody's holding a gun to your head and forcing you to use a GPLed work as
> the basis for yours. If you don't want to play by the GPL's rules, fine;
> nobody is forcing you to do so.

That's a bit too simple for me. The problem is, "do I have a choice?".
Coming back to the square-root example above: Provided it would have been
put under GPL, and someone would "use" it with non-GPL code, then we would
have a copyright violation. If, however, the code would have been modified,
when would it stop to be one? Or, to put it even differently, is it possible
to pull the square root using the same mathematical idea *without* using
a code what would violate the GPL?

Now, at this point it gets hard: Either, the second party puts a lot of
brain-power into creating an algorithm that is similar, but not too
similar, which might be hard given the problem at hand, or the second party
switches to a different, less efficient algorithm. I don't think both options
are fair because the given problem at hand is "so simple to make it
hard to come up with a different code".

> That doesn't mean you can base your code
> on a GPLed work, though, any more than you could break into Microsoft HQ
> and base your work on the Windows source code -- even if you change or
> discard 90% of the original work's code.

No, clearly not, but by placing GPLs on simple code means that anyone
else who do not want to GPL code has to work harder than the original
author. Now, you can argue, the same holds for patents and all other
copyrighted work. Clearly, but as for a patent, for example, the invention
must have be a certain value - I don't know the technical term in english.
What GPL does is that it places restrictions on code without checking for
this condition.

Greetings,
Thomas

Uh... 'durmiendo el sueï¿½o de los justos', as we say ;-)
I've been working on some other things lately (though I've kept checking the
algorithms needed to convert an RGB-coded image to something the A8 can
process). Of course, all that will be done on the PC so that the A* only has
to display the images properly.

I believe that "using an algorithm ends" as soon as there are same
variable and function names, same comments, same code structure and also
same data tables including bugs in the new source as are in the original
one.

>> When you use another's code, even as something to modify so it suits

>
> But why do you take it for granted that I did?

Thomas, this is getting boring. Do you really want some third party to
compare the source code of Atari800 v0.9.7 (released in 1998) and current
atari++ in order to find out if GPL was violated or not? Perhaps we could
ask the Free Software Foundation? I still hope that this is not necessary.
Perry identified bits of similar code in Antic and Pokey and Jason found
his code in the CartRT8. So please put there the copyright notices, credit
the original authors and you are done. Is it really so hard? Many people
take free code of other authors and improve it - they just keep the
credits of the original authors, don't claim they wrote the original parts
by themselves and that's it. Nobody thinks they are bad programmers if
they started from someone's else code. Even better, if the header file
contains something like

```
***********************************************
* Pokey emulation (c) 1995 Ron Fries
* released under the GPL
*
* Thomas Richter (c) 2001 - rewrote 99% of this, improved greatly by
* adding 16-bit sound, low pass filters and whatever else
***********************************************
```

then everybody can see that you have made it much better and that's
great. At the same time, you don't claim you wrote it from scratch and so

it doesn't look like you are stealing someone's else work.

I'm working on a game.
I'm not making a super graphics joystick game.
It's a 'port' of a hp 48gx calculator game.
It's in BASIC, and has to be compiled to run
fast enough.
A two dice game called 'Skunk'.
I've got graphics, text in a graphics field, dice that
show the dots as you roll them.
Takes me back to years of Atari BASIC programming.
A flower pot and a vase.
It's playable now, but needs a lot more work.
I ran out of RAM, it's about 27k now, so I took my
PLOTS and DRAWTOs and just made a string out
of my graphics screen, saved about 8k. I've got
about 4 ml snippets to do little stuff, like load the
screen from the screen and do some bit twiddling
which ml is a lot better at than BASIC.

I figure about two months and I'll put it on my
site.
Regards,
Russg

FYI, we have a new pokey emulation in Atari800 as of v1.2.6 so it is
indeed possible.

> A third solution I could offer is to allow re-distribution of the source

My intent is simply to keep the atari++ going but also fulfilling the GPL
of Atari800 that we believe was used as a starting point of at least the
antic, pokey and cartrt8 emulations. Let me ask the FSF whether allowing
re-distribution of the source as GPL is the same as releasing a derivative
work under GPL. If it is then we (you and me) win.

> A forth solution we could find would be to use a licence similar to the

This is interesting plan though I can assure you that no fork of atari++
would ever appear as long as the main atari++ would be released under an
Open Source license. There would simply be no reason for that as you are
doing great work on the emulator.

It's not just the GPL here. Your actions could have caused problems with
other licenses, too -- even the VERY liberal BSD license, since it
requires attribution and, IIRC, reproduction of the BSD license. (Again,
whether or not you actually based your code on others' work is another
matter; the mere accusation can cause problems under ANY license.) I
suspect you'd have found it easier to stomach adding that attribution
than relicensing under the GPL, though.

First off, a license has nothing to do with algorithms, just with code.
Second, I was imprecise when I said that the line between algorithms and
code can be hard to see. The distinction between an algorithm and its
implementation is pretty clear; it's just that some algorithms are so

simple that they may have few distinct implementations in a given
language. This gets into an area of copyright law that's murkier for me,
but I doubt you could copyright such a simple line of code. Something like
a line that reads "i++;" certainly isn't copyrightable, AFAIK; that'd be
like trying to copyright a single word.

>> The algorithm expressed by
>> your 29 lines of code could certainly be expressed in other ways.
>
> Certainly, but at which point would, provided the above had been
> set under a licence, a copyright violation start and where would it
> end?

First off, a license is irrelevant, at least in the US. By US law, you
already own a copyright to the code you posted -- at least, assuming you
wrote it. (If you copied it from elsewhere, your posting it may technically
be a copyright violation.) Assuming you wrote that code, nobody else may
use it. I cannot take that code and put it in a program of my own, at
least not without your permission.

As to what's a violation: Exact reproduction is certainly a violation. So
is taking that code and reworking it. For instance, I couldn't take your
code and change the comments or variable names, or perform other
substitutions like that, and call it my own. OTOH, I can legally take
that code, analyze it to figure out the algorithm it implements, and then
write a new piece of code that implements the same algorithm. This
distinction is logically pretty simple, but of course in practice it may
not be when examining the results of each process. That's certainly a
potential problem, and one that, in extreme cases, requires intervention
by the courts.

Try to think of it in terms of the process rather than the product.
Unfortunately, a third party looking at the code doesn't have that luxury

and must judge similarity based on the product. That's admittedly sometimes a tough call. I'm not familiar enough with the technical problems at hand, nor have I seen most of the disputed code, so I'm not willing to judge whether your code really was derived from the GPLed Atari800 code.

There's also another option: clean-room. If you don't look at the GPL code, you can't copy it. That may not be an airtight legal defense, but in my own very personal view, if I thought that a person had not seen allegedly infringed code, I'd accept far more similarity as innocent than if I thought the alleged infringer had seen the code in question. I know there are commercial projects that have used clean-room techniques in creating workalike products. IIRC, some of the early non-IBM x86 BIOSes used these techniques, and I distinctly recall hearing about it in reference to some (failed) attempts to clone Mac OS several years ago. Presumably the companies thought these techniques had some legal value or they wouldn't have used them.

> else who do not want to GPL code has to work harder than the original
> author.

You're talking as if the GPL were special in this respect. It's not. Your gripe is with copyright generally; if Microsoft, to continue the analogy, thought you had infringed their code, they could come down hard on you -- almost certainly harder than the Atari800 developers have done. The main difference is that Microsoft's source code isn't as readily available, so claims of infringement would probably require Microsoft to prove that the defendant had access to the code. (I'm assuming here; my knowledge of that aspect of copyright law is limited.) You admitted up front that you read the GPLed code, though, so you made it easier for others to claim you'd infringed their work. If you want to avoid this possibility in the future, stop reading GPLed code. You'll almost certainly learn less, but it'll be no worse in this respect than if the GPLed code had actually been commercial in nature, with source code locked away.

I'll also add that your own license doesn't do anything to reduce the risk of claims of infringement for other programmers. Hypothetically, if five years from now you find something that looks like your own code in some other project, you could raise a ruckus, sue the other person, and possibly even win in court. By not granting any rights to use of your own code in your license while griping about the GPL and its limits, you're trying to argue both sides of this position -- you want absolute control of your own code, but you want free access to others' code.

> Now, you can argue, the same holds for patents and all other
> copyrighted work. Clearly, but as for a patent, for example, the invention

> must have be a certain value - I don't know the technical term in english.
> What GPL does is that it places restrictions on code without checking for
> this condition.

Patents are an entirely different issue. In the US, at least, patents CAN apply to algorithms, and that can cause a lot of problems. I don't know of any case where a copyright has prevented a programmer from implementing an algorithm, but there are lots of documented cases of patents being used to that effect.

One more point that's not terribly related to this specific message but that recently occurred to me: One of your objections to the GPL is what you and Microsoft refer to as its "viral" nature; however, this feature applies only to downstream users of the code. If you write a program and release it under the GPL, copyright law grants you the right to also release it to others under other licenses. Thus, if somebody came to you and wanted to use some or all of your code in, say, a closed-source commercial product, you could still grant that right, without affecting the GPLed branch. In this specific case, there are a couple of caveats, though. First, the presence of disputed code in Atari++ specifically means that you might not be able to grant full rights to the entire program, although you could almost certainly grant rights to the undisputed files. Second, in order to retain this right while development continues, you'd need to get every contributor to sign over the copyright to the code to you. Without that, it would eventually become impossible to separate what you own from what others own, assuming you get more than trivial submissions. There are open source licenses that exist to address this second point. The Mozilla Public License (MPL), for instance, does this, if I'm not mistaken. The MPL doesn't give you the sort of absolute control over derivative works you want, though, and no open source license does; but I thought it worth mentioning. You may want to take some time to peruse some of the non-GPL open source licenses that are available:

http://www.opensource.org/licenses/

There's a chance you'd find one of them acceptable for future projects, or even for Atari++ should you strip it of the allegedly infringing material or otherwise reach a compromise with the Atari800 developers.

I'm guessing the newest stuff is from Europe. :^)

There's definitely some cool new demos (like Numen, which demonstrates
the very cool 3D polygon graphics being developed for the game Vector).

My latest game was from back in 1997 or 1998; Gem Drop.
http://www.newbreedsoftware.com/gemdrop/

I started working on another new game (like Puzzle-Bobble, I guess)
recently, but haven't had time to work on it more.

Hehe - This was as far as I got, so far:

http://www.sonic.net/~nbs/jam.gif

I started working on a way to create 9-color images, so that I can take
advantage of the Atari's 128 colors (palette will change between frames).

I didn't get too far with that, and haven't had time to work on it lately.

Sorry! :^)

On the part of the Atari800 developers, they were simply trying to
have a violation corrected.

> Pulling a project rather than quietly settling a difference over a code
> segment

To be frank, Thomas is the one who pulled his code, and brought this topic
up to the comp.sys.atari.8bit group (and melodramatically, at that).

> and then trying to pretend it's the principal of the thing?

It is the principle of the thing. Why should people bother writing software
if it gets abused? Who does that help?

> Quoting Linux etc? Exactly how does that serve the A8 community..?

The only reason to do comparisons to Linux is because it's the most
well-known example of software released under the GNU General Public Licese.

> Secondly we all have the right to an opinion here including you and me, don't

This is true.

If it weren't for Atari800, I probably wouldn't be nearly as 'into' the
Atari 8-bit scene as I am. Not that I'm doing much (other than talking
and some little design and occasional code).

Sorry, Thomas, but based on what I saw, you didn't respond to Petr's
e-mail for two weeks, at which point he e-mailed you again, and you
decided to post his request to c.s.a.8 and "shut down" your project! <:^{

Correct me if I'm wrong.

> }
```

In programming, there's always more than one way to do it!

Comparing the Atari800 and Atari++ code, they are FAR more similar to each other than your 'sqrtint' function and mine below:

```
unsigned long long sqrtint(unsigned long long n) {
long long q, z, w, t;
int i;

q = 0;
z = 0;
w = 0;

/* I could have also done q = z = w = 0; too! Three ways to do it! */
```

```
for (i = 0; i < (sizeof(long long) / 16); i = i + 1)
{
q = q * 4;
w = (w * 2) - 1;
z = z * 2;

if (n < 0)
z = z | 1;

n = n * 2;
z = z * 2;

if (n < 0)
z = z | 1;

n = n * 2;

t = q + w;
if (t <= z)
{
w = w + 2;
q = t;
}
}

return ((w - 1) / 2);
}
```

Sure looks different, doens't it? I obviously based that /directly/
on yours, but it definitely looks more different than the quoted pieces
of Atari800 and atari++ (see the post where I forward Perry's comparison).

It could have been even more different! I could have used different
variable names, or used a "while"-loop instead of a "for"-loop.

> is a copyright violation, though I'm pretty sure someone else has
> been "equaly smart".

It depends. Did you _copy_ that? Or did you just come up with it using
your own mind? :^)

Sorry Bill, I wasn't trying to blast you there, I was just pissed at the guy who was adopting the "if you can't do better you cannot have a say yourself" stance. The only emulator I ever wrote was a CL800 emulator on an ST.

That said, it seems that so much space has been consumed with this issue - surely Godwin's Law will be coming into action soon! Still, argue in public and expect everyone to join in!

Best regards,

Duncan

I'd like to get some opinions on what the best assembler is for 8-bit Atari (specifically, 800XL). I know there are a few out there, so I'd like to make sure I'm concentrating on the one that is most feature rich and design for professional application development.

Thanks!

# 898. New auction - 'Advanced Programming Techniques For Your Atari Including Graphics & Voice Programs' (Linda M. Schreiber)

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-06 22:43:42 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1044571418.26088.0@dyke.uk.clara.net>
Source record: 23409

Hello All,

I've just started a new auction for the book: 'Advanced Programming Techniques For Your Atari Including Graphics & Voice Programs' (Linda M. Schreiber). This is a particularly strong book on advanced graphics techniques.

I still have the 850 field service manual, DGS light sensor box, and SpartaDOS R-TIME8 disk for auction too, along with some non-Atari items (ZX81 board and a 1975 PDP11 software handbook!)

The link is below (this will split on to two lines, so please copy both lines into yourbrowser):

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=deangarraghty

I must admit, although pretty slow, I like AMAC from Atari. Mac65 is really
fast, but I found AMAC to be pretty good, cause then I could use Textpro as
an editor!

For most of them, writing the code is the self-gratification. I don't see any
personal aggrandisement on the A8 mailing list, so I don't know what you are
talking about there.

> Pulling a project rather than quietly settling a difference over a code
> segment and then trying to pretend it's the principal of the thing?

The A8 developers did contact Thomas privately about the matter, it was Thomas
who took it public on this newsgroup. It was also Thomas who pulled the
project. Seeing his project, ideas, and code disappear forever is the last
thing any A8 developer wants as there may be things from A+ that might benefit
A8. He started this mess, and then you jump in and start cussing out the A8
developers as if the whole thing is their fault and pinning on them bad

motivations that they simply don't have. Take a step back and look at this picture again, buddy.

> Quoting Linux etc? Exactly how does that serve the A8 community..?

Linux is the most obvious and well known GPL'd project.

> Secondly we all have the right to an opinion here including you and me, don't
> forget it kid.

Sure, you have the right to act like an idiot here, cursing and insulting the people who created the programs that you (or at least others) now use for entertainment, and I have the right the flame your ass for it, child.

> I use real Ataris and I have a heck of a lot of original software so I did

Then don't speak upon a subject for which you know nothing about child. If you were part of the A8 project for any length of time as a user or developer, you would know they aren't "drama-queens" or any of the other insults you've thrown out so far.

> Also you have no idea what software I write or don't write in the public
> domain, don't assume.

I don't give a damn what software you've written. You obviously aren't part of the A8 project and you aren't Thomas and that's all that is relevent to the ongoing argument, and if you are a software developer, I'm astonished at how little regard you show for your fellow programmers. If you don't like their choice of software license, fine, attack the GPL as Thomas is doing. If you look closely at what Thomas is saying though, you'll realize he isn't insulting anyone by name calling nor using foul language, so I say again, if you can't be polite then shut up, or if its just a flame war you want, I'll be happy to oblige. Fire at will child.

That's true. I suspect that most licenses written by the programmers could be
easily torn apart by the lawyers if it ever went so far as to end up in a court.

Doesn't GPL prohibit the non-GPL licensing of a project containing GPLed
parts?

AFAIK LGPL is ok for that. Or are the mentioned parts released under LGPL?

## 905. Re: Which assembler?

Why don't you want to cross-assemble? Far quicker, then use an emulator to debug.

Look for CA65 (part of the CC65 suite) or TASM, DASM.

Rgds,

Mark

Code extracts have been posted showing similarities between your code
and GPL'ed code. Could you comment on them? Since it is your
software in question, and those bringing the issue have stated their
position, disclosing the particular code they find of interest, then
it is up to you to answer the allegation. If you choose not to, then
any escalation in the matter is your own responsibility.

>
> > When you use another's code, even as something to modify so it suits

>
> But why do you take it for granted that I did?

So far, the people raising the issue have shown some of your code that
exhibits syntactical and architectural similarities with some GPL'ed
code. I am entirely open to you explaining the similarities, thus
proving there is no GPL code in your software. So far, I've not seen
you speak to that issue directly, instead simply dismissing it. So,
perhaps I'm being presumptive about thinking the code is very likely
based on GPL work, and I apologize for that- however I think you
really must comment directly on the code in question- anything less
begins to resemble evading the issue.

>
> > It seems silly to play around with licenses when the solution to the

>
> Technical, in which sense? In the sense that I could resolve the problem
> by offering a different code?

Technical in the sense of being resolved in sourcecode instead of licensing gymnastics. If the code is different and reasonably not derived from GPL software, then that is probably a solution. Homebrewing your own sort-of GPL compliant licensing scheme isn't solving the problem.

Gregm

# 907. Re: Any new games for the ATARI 800 XL/XE ?

Newsgroup: comp.sys.atari.8bit

Source record: 23419

Hi,

Atari 'Elite' is STILL only 1/2 done :-( sorry! (demo available from
http://www.iancgbell.clara.net/elite/demos/)
(don't press the keyboard in the demo or it locks, just the Start Key to
cycle the views ;-)

I had a little look at a better 'Barbarian' conversion (see the thread on
http://www.atariage.com/forums/viewtopic.php?t=11624)
the C64 code is so nicely structured that a full port wouldn't be too hard.

Another dream is to clone the NES English translation of the the Japanese
'Final Fantasy 3' game...
I love it, so much so I have a cartridge that I can't run! Oh, and then
there's Speedball too!
The music for that game is great (ST and C64)! Now that 'RASTER Music
Tracker' is in progress
I'm looking forward to making use of it!
(http://www.infos.cz/raster/atari/rmt/rmt.htm)

I'm also disassembling the C64 International Karate+ code which I'll pass
to
the Polish guys doing a conversion of this. (see http://www.uce.pl/ikplus/)

Same problem as everyone else though... work keeps me too busy, wife + 2
young kids,
plus other coding distractions such as KVM and uClinux.

Hope that helps... Take care,

Mark

Being the author of the new 'mzpokeysnd', I was never said by the other
Atari800 developers that my work is a derivative from Ron Fries and others.
This is because the code was really written from scratch.

One could compare the old and new pokey emulation engines and try to find
such similarities that could indicate a derivative work ;-)

> I have an aversion against.

Thats fine Thomas, you can choose whatever license you want for your code. My concerns are two-fold. First, there is the obvious issue that A+ seems to contain A8 code which is GPL'd, but lets leave that aside for the moment. Second, at one point you said your license was in the spirit of the GPL when in reality its just the opposite. If you really believe that then you really don't understand the GPL, and that was my point in my comment above. Your desire for "full control" of the source is fundamentally and spiritually in conflict with ALL open source licenses, but most especially the GPL. Your license essentially says "look, but don't touch". Now a user might call that "open" since he can see your source code, but in the open source community among programmers, "look, but don't touch" is essentially closed source to them, since why would any *programmer* look at your code other than to modify it, or borrow from it. So this is my main point here, to be open source is to by definition give up "full control" over the code. If full control is what you what, you really should just close the source altogther and make it proprietary. I can understand your desire to keep the code in good shape, but the GPL doesn't stop you from that. After more than a decade, Linus is still the benevolent dictator of the Linux kernel. He obviously hasn't lost any control.

A little update. I do indeed have CN for J/F 1992 but it turns out
that Ben Poehland left the magazine following the Dec 1991 issue.
Therefore, it seems that "Secrets of the 1050" was not published by
Current Notes. Ben went on to write for Atari Classics, but Larry
assures me that the article never appeared in AC either.

BTW- It should be Joe Waters not "Walters" in my orig post

I ran across this today while sorting through a group of "misc disks" I've accumulated from Atari swap fests, etc. It was sold by VERVAN, publishers of a number of tape and disk utilities from the early-mid 80's. I don't recall seeing this one before, so I looked back at a few Vervan ads and couod not find it mentioned. It looks like some kind of a utility to make a tape file out of binary files. (?) Does anyone remember this one and what it really does?
Larry

Thomas: what you posted is not an *algorithm*, it's *code*. An algorithm isn't written in any particular programming language, it's just the explanation of the steps needed to perform a task. The code, OTOH, is a particular

implementation of that algorithm. We used to get algorithms in Numerical Methods class, where each of us had to implement a certain algorithm explained to us by the teacher. It may not seem so at first, but the distinction between 'algorithm' and 'code' (the implementation) *is* important here. Best example I can think of right now is DFT (Discrete Fourier Transform), as a mathematical formula it can be considered an algorithm; it can be implemented in many different ways, one of the most popular ones is the FFT (Fast Fourier Transform), and many people have provided different implementations.

I couldn't say about the others, but my intention would be
to release the ATR image (and CAS maybe) into the Public Domain.

A cartridge version would then be available mail-order
(probably through Video 61 in the U.S). This is a long
way off though.

Regards,

Mark

Looking forward to hearing the new mzpokeysnd code in Atari800:-) Sounds like there has been some good work on this recently. One good thing that has come out of the Atari++ argument from my perspective:-)

Would you let Thomas rework your code for Atari++? Then he can get rid of his (allegedly Ron Fries) version. Of course I can't speak for him here...

The explanation of the algorithm was probably written in some kind of code
too. There are many ways to explain an algorithm, each in some kind of
code. Just because Thomas wrote this in C.

Hmm, good luck... they're not even common here in the states, really. Usually when one becomes available there are collectors snatching them up.

I had one a few years ago but I gave it to a friend of mine who is an avid Atari collector in France. He was happy to get it, especially when it was in good condition and had a serial # of 506!

I still see one very rarely in a thrift store here and there and will let you know if I do so again anytime soon.

Funny how it went from the computer that nobody wanted in 1982 to the one that people like here 20+ years later!

UPDATES SINCE PREVIOUS POSTING
2003.01.25 ***NEW POLICY: email addresses included only when there
is no known web page to point to.
2003.01.22 Steve Tucker updated-- APE and ProSystem 2.0.5
2003.01.18 Mark Grebe updated (Atari800MacX 1.2.0)
2003.01.18 added Vasyl Tsvirkunov (Pocket Atari emulator for Windows CE)
2003.01.18 added Sunmark Products (Hollex Cart, InstaDOS Cart, PCB's,
Real Time Cartridge (ICD R-Time 8 clone)
2003.01.18 Thomas Richter updated (URL, atari++ 1.14)
2003.01.18 added Steve Goss (Contagion, Zero War, Plastron)
2003.01.06 Thomas Richter updated (atari++ 1.01)
2003.01.06 Ullrich von Bassewitz (CC65 version 2.9.0)
2003.01.06 added Jeffrey S. Worley (offers free hardware upgrades)
2003.01.03 Associated Enterprises (Victor Halling) email bounces
2003.01.02 Christian Groessler updated (Atari800 DC v0.72)
2002.12.31 added Thomas Richter (atari++)
2002.12.31 Matthias 'Hias' Reichl (HiassofT) updated, WriteAtr V0.92a
```

2002.12.31 Tom Hunt updated (Mouse 03 and Mouse 78 programming languages)
2002.12.19 Mark Grebe updated, Atari800MacX 1.1.0
2002.12.19 added Spike's Systems and Computer Repair
2002.12.16 Video 61 & Atari Sales updated, added K-Products products
2002.12.16 removed K-Products (Bob Klaas)
2002.12.12 added Komires (EMUAPC DEMO 0.90 Beta)

---

Subject: Introduction

Conventions
---
All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" =3D Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" =3D Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" =3D Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" =3D Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

SAE/SASE/IRC info from http://www.genfair.com/greenpages/sae.htm
---
It is courteous when writing to any new correspondent to cover in advance their postage costs in replying to you. If they are in the same country it's a simple matter to enclose an SAE (stamped addressed envelope), which is known in American English as an SASE (self-addressed stamped envelope). It is not always obvious how to do this for correspondents in another country. One answer is to use International Reply Coupons.

An International Reply Coupon can be purchased at any Post Office in any country in the world. This is agreed through the Universal Postal Union. You can then send the IRC to someone in another country who can cash it in at a Post Office there for a postage stamp covering the minimum rate for an Airmail letter (unregistered).

One IRC enables a letter up to 10 grammes to be airmailed abroad. That's not much more than a couple of sheets of paper. So if you want a reply with more

than this, better send two or more IRCs!

Verfications -> YOU!
---
This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

---

I can consider releasing mzpokeysnd (that version of it which does not
contain modifications by Krzystof Nikiel) under another license. However,
allowing to apply 'THOR' license for the module frightens me a bit. A
license composed not by a law professional may contain such terms which
could be found illegal or contradictory by a court. And then the rights are
no longer protected by these terms. On the other side, I beleive that GPL
was composed by some expert people. There were no modifications to the GPL
text for many years, and this proves stability and legality of the license
terms. Therefore I think there are less chances for the GPL or its parts to
be considered illegal/contradictory.

Of course, Thomas can take mzpokeysnd and remez from the Atari800 CVS any
time and use them under the terms of GPL and LGPL, respectively, without
anyone's additional permission.

I've made a 1050toPC cable and I've got a CA 2001 disk drive. And this cable doesn't work. I can format diskettes in this drive, but can't write .atr files into the real disks.

Question: Does 1050toPC work only with 1050 drives?

/mcdenko

> parts?

Yes, but the person who holds the copyright to a product is not bound by
the licensing terms imposed on others, and a copyright holder may in fact
grant licenses to different people on different terms, or offer a choice
of licenses. There are plenty of examples of people using dual licenses,
for instance (Perl uses both the GPL and the Artistic license, as one
example). Thus, if the authors of the allegedly infringed code so wanted,
they could grant Thomas a non-GPL license to use the code that was
allegedly infringed. The trick, as Petr notes, is that some of these
authors have dropped out of view, so even approaching them about it seems
to be difficult.

> motivations that they simply don't have. Take a step back and look at this
> picture again, buddy.

This is not quite the case. Much of the discussion was also going on
privately and has not been posted here. In fact, the first reaction was
that Petr demanded to put the project under GPL, which I replied that
I'd rather put it under BSD or any other licence without the "virus".
No matter how you like GPL or not, this is my opinion about the field.
Anyhow, at that point, Petr stated clearly that this wasn't possible, so
the conflict arose. Now, at this point, we do seem to approach a common
point.

It also seems to be a common misunderstanding that licences were chosen
to make the software non-free in the GPL sense. I tried to keep the licence
"close enough" to provide best quality, but it seems that this shoot back.
I've made positive experience with this (mine) licencing conditions at the
Amiga scene and everyone was happy about it, though I'd just continue with
the model. Aparently, people and opinions are different here. That mistake
made, the basis for the conflict was given.

> I don't give a damn what software you've written. You obviously aren't part

> insulting anyone by name calling nor using foul language, so I say again, if
> you can't be polite then shut up, or if its just a flame war you want, I'll be
> happy to oblige. Fire at will child.

That, however, is quite true. All the "drama" by side, I don't see *any*
reason to get personal. This is the very last thing that'll help.

Anyhow, I'll ask now politely all the parties to keep calm. We're really
approaching a solution, and if that is reached, we can continue with the
work.

I very sorry that emotions came up that high, please forgive. Anyone here invested too much work into the software to feel arbitrary about it.

Thanks,
Thomas

Probably yes. That's why Thomas offered dual licensing and a
"re-distribution" of atari++ under GPL. That sounded to me like something
that (plus crediting the original authors of Atari800) would correct the
(possible) violation caused by (suspicion of) using GPLed Atari800 code as
a base of atari++.

That's why I sent a letter to FSF asking if this "re-distribution under
GPL" would do it. I am sure they will look at me like at an idiot since
they would have to ask why Thomas simply doesn't release it under GPL
directly. They naturally haven't read all the reasons Thomas has against
that license. Anyway, their answer can get us over this, hopefully.

Petr

> First off, a license has nothing to do with algorithms, just with code.

That's clear. What's not clear is the meaning of the word "implementation
of an algorithm".

> Second, I was imprecise when I said that the line between algorithms and
> code can be hard to see. The distinction between an algorithm and its
> implementation is pretty clear; it's just that some algorithms are so
> simple that they may have few distinct implementations in a given
> language.

Exactly, and at that point it is getting mood when trying to copyright it.

> This gets into an area of copyright law that's murkier for me,
> but I doubt you could copyright such a simple line of code. Something like
> a line that reads "i++;" certainly isn't copyrightable, AFAIK; that'd be
> like trying to copyright a single word.

Or like trying to copyright the NUL termination of strings (a popular
april fool a couple of years ago). Anyhow, I'd say that this pretty much
leaves things open for interpretation.

>>> The algorithm expressed by
>>> your 29 lines of code could certainly be expressed in other ways.
>>
>> Certainly, but at which point would, provided the above had been
>> set under a licence, a copyright violation start and where would it
>> end?

> be a copyright violation.)

This isn't much different here in Germany either.

> Assuming you wrote that code, nobody else may
> use it. I cannot take that code and put it in a program of my own, at
> least not without your permission.

Let's come back to the above algorithm as a case study; to make things
a bit more concrete. I wrote the above lines indeed, and I also came
up with the algorithm at hand. However, when I had the assignment to
fix the implementation of a math library about a year ago (the
mathieeedoubbas library of the AmigaOs) I found to my amusement that
the algorithm used to compute the square root there was written along
the same idea. The code also gave a reference where it came from (a
scientific paper whose author I unfortunately forgot).

Now, here's the question:

a) Is the above code under my copyright? I've written it, clearly, but
given that the publication dates back further, I cannot claim of having
invented it (at least as the first invention).
b) Stated that the math library at question was delivered (in binary form)
without giving references to the author of the algorithm, does this imply
that some kind of copyight law has been violated?

My understanding is that a) yes, I do hold the copyright, and b) this is
legal because the code is copyrighted, not the square root algorithm.

However, given two implementations at hand, how could I prove that still
my implementation is my copyright? Or even worse: Who would have to
prove that it is? Do I have to prove it's mine, or does the other party
have to prove that it is not?

All this seems pretty moody.

> As to what's a violation: Exact reproduction is certainly a violation. So

That's also currently not the question. As far as I can see, we're
approaching a solution in one way or another. I'm speaking about the
situation in a more general framework.

> There's also another option: clean-room. If you don't look at the GPL

Unfortunately, in this specific case, a clean-room approach has been
impossible. I *had* looked at the original since I even worked on it for
some parts. If you'd read Bill's posts clearly, then he had to go back
a lot of releases to find similarities - obviously.

What can one do in these cases? Not write the software in first place?

> I know
> there are commercial projects that have used clean-room techniques in

That's what I've been trying to avoid when working on the emulator as it
is now. The point is that about the old parts I haven't had much of a
choice to begin with.

> You'll almost certainly learn less, but
> it'll be no worse in this respect than if the GPLed code had actually
> been commercial in nature, with source code locked away.

Clearly, though this is not quite the situation.

> I'll also add that your own license doesn't do anything to reduce the

> trying to argue both sides of this position -- you want absolute control
> of your own code, but you want free access to others' code.

The problem is, as you explained successfully, that my intention hasn't
been made clear within the licencing condition. Your understanding of the
licencing model, the above scenario could, however, happen.

>> Now, you can argue, the same holds for patents and all other
>> copyrighted work. Clearly, but as for a patent, for example, the invention

> and wanted to use some or all of your code in, say, a closed-source
> commercial product, you could still grant that right, without affecting
> the GPLed branch.

Exactly, and I do understand this case. However, looking back at all the
mess we've been thru now - I hope - I doubt that GPL violations can
be stated clear enough, and make it IMHO hard to develop software
independently without getting at least in a legally mood zone. In principle,
still someone could look at my code and argue that code parts have been
stolen from somewhere else. Then I still had to argue whether this applies
or not. Hence, GPL places potential work and risk on the shoulders of
authors that do not want to follow GPL to begin with. I'd rather say that
*if* you're liberal enough to publish sources, you've to deal with the
potential situation where parts of the code get reused. I'd rather compare
this with the scientific world: Once the paper has been published, the
result is open for everyone to use, and everyone is encouraged to use it.
I don't see this much different from published free code. If I do not
feel like this, I cannot release sources, but must release binaries.

Yes, I've found this reference already and I've to look thru it. I've
read a couple of the licences presented there, but the MPL wasn't one
of them. Sounds like an interesting point, though.

> There's a chance you'd find one of them acceptable for future projects, or

Hi,

> Thomas Richter <thor@cleopatra.math.tu-berlin.de> wrote:

/* snip */

> In programming, there's always more than one way to do it!

Concerning the code? Maybe, thought the algorithm is the same.
Given your implementation, one could also argue that an attempt has been
made to "hide" the origin (which is here of course the case since
we're playing hypothetically with that code in first place).

> Comparing the Atari800 and Atari++ code, they are FAR more similar to
> each other than your 'sqrtint' function and mine below:

/* snip */

Is it? Given the size of the sqrt code, and given the size of
the antic code as total, the modifications of your sqrt code are rather
minor since the algorithm is quite the same. I don't know how today's
a800 antic looks like, but comparing mine with David's original it
works really quite different. What *is* identical - and that I don't
deny - is that the approach building up the mode lines by means of LUTs
is the same. I'm now switching to another approach.

> Sure looks different, doens't it? I obviously based that /directly/

>> been "equaly smart".

> It depends. Did you _copy_ that? Or did you just come up with it using
> your own mind? :^)

See above my answer to Rod. Fact is, I came up with the above indeed, but
later on found to my amusement that this is a well-known algorithm at hand.
(To be precise, when I worked on an Amiga math library that used precisely
that).

So long,
Thomas

Hi,

> Thomas: what you posted is not an *algorithm*, it's *code*. An algorithm isn't
> written in any particular programming language, it's just the explanation of
> the steps needed to perform a task. The code, OTOH, is a particular
> implementation of that algorithm.

I understand this pretty well, though this is not quite the point I wanted
to make. Actually, if you'd follow my reasoning, I posted this to demonstrate
that the distinction between the two is sometimes a bit moody and makes it
hard - especially for simple algorithms - to come up with something entirely
different. And, compared to the LUT build-up code, the above is rather
complicated.

So long,
Thomas

You might not know this, Bill, but I already offered earlier to release
the source under a different licence, BSD or LPGL to be precise. I got
no reaction on that other than "GPL or nothing". I had to pull the
emergency breaks at some time, though.

So long,
Thomas

Which version of the 1050-2-PC cable did you build?

The pro-system cable (using a 14C89) doesn't work reliable with all
serial ports. For example, it works with the serial port on my
mainboard, but not with the ports on the expansion card in my
computer.

OTOH, the MAX232 version (as described in the SIO2PC docs, needs
external +5V supply) worked fine with all computers and all ports
I've tested it with so far.

Anyway, try re-checking the circuit, maybe you've placed a
capacitor the wrong way, got a short circuit, swapped two
pins or another small mistake like that.

> Question: Does 1050toPC work only with 1050 drives?

I don't know - I've only tested it with 1050s yet.

so long,

Hias

This is true. I haven't commented on the other license you offered and continued convincing you that releasing under GPL would be far the best solution for this issue. And I haven't got a reply from you for those two weeks.

Anyway. What is (and has always been) important is to give proper credit to everybody that helped (even indirectly, as you may think) to make atari++ reality. And if the original authors decided to release their work under GPL to protect it then we must deal with it somehow. The easiest and right solution has been mentioned here 1000x times. If we find another legal and sensible solution that is OK with you, then let's use it.

BTW, in the meantime you could try to search for David Firth and Ron Fries by yourself. I wasn't successful but you may have a better luck. If they said OK to your LGPL or BSD then we could stop this immediately.

Petr

P.S. This searching for people on net brought me an idea that everybody should have a life-time e-mail address, assigned automatically as soon as he/she borns.

Hypothetical dumb question here (I'm a software developer, but commercial - haven't done any opensource/GPL/etc yet).

Lets say in my program I need to pop up a message box asking "Are you sure you want to quit". Lets say I don't know how to do it (some windows API I haven't used). If I look at the source to a GPL program and see they have it, and its 1 line like "MessageBox(...)", and I put it in my code, have I violated the GPL?

How far does the license go with small things like that?

Thanks,

Frank.

I don't think there'd have been much fuss over your licensing if the allegations of your having used others' code hadn't come up. Now that it has, of course, the discussion has expanded to include a far more intense look at your license than would otherwise have occurred.

Also, as a historical side note, the Amiga (and Atari and Macintosh and early PC, etc.) hobbyist development communities have been historical latecomers to what's today called the "free software" or "open source software" models of doing things. The free/open source development models derive from academic traditions of information sharing. Those traditions weren't at the basis of "home computer" hobbyist development, so the licensing terms have historically been different. Perhaps my own perspective as a professional Linux author warps my view, but my impression is that the free/open source development and licensing models have largely eclipsed the more restrictive "freeware" development style common on early home computers. Your license definitely falls in this home computer spirit, and yet the software was released for platforms on which much more open licenses are common (namely, Linux and perhaps other Unix-like systems). You certainly have every right to do this, and you wouldn't even be alone in releasing non-open-source code for these platforms, but it makes your license stand out as bizarre in the community in which it resides.

> a) Is the above code under my copyright? I've written it, clearly, but
> given that the publication dates back further, I cannot claim of having
> invented it (at least as the first invention).

Just because earlier code uses the same algorithm as yours does not
invalidate your copyright. If the earlier copyright holder also held a
patent on that algorithm, you might be in hot water for using it, but
that's another matter. You can copyright code, but not algorithms. Now,
if your implementation was too similar to the earlier version, you might
still be in trouble, but I don't really know precisely what standards
apply in a case like this. In the specific case of Atari++, some of the
allegations and code snippets posted do look very suspicious, but I've
not seen enough evidence to draw a firm conclusion, and my limited
knowledge of emulator internals in general is also a hindrance to me
personally.

> b) Stated that the math library at question was delivered (in binary form)
> without giving references to the author of the algorithm, does this imply
> that some kind of copyight law has been violated?

No. To the best of my knowledge, copyright law doesn't require giving
references to parties from whom you may have obtained an algorithm. Many
(most? all?) open source licenses do require attribution when you use
their code, but that's a different matter -- code is not the same as an
algorithm.

> However, given two implementations at hand, how could I prove that still
> my implementation is my copyright?

The safest way to prove that you own a copyright, at least in the US, is to register it with the copyright office immediately after you create the work. This isn't legally required, but it makes it much easier to prove you own the copyright if a conflict arises. Failing that, if you can point to some sort of dated archive in which your code resides, that would help a lot. For instance, if your code were on a shareware CD-ROM with a date, that might qualify as proof. I don't know precisely what would constitute proof, though.

> Or even worse: Who would have to
> prove that it is? Do I have to prove it's mine, or does the other party
> have to prove that it is not?

If the other party were to see your code and claim a copyright violation, and if that person were to bring you to court over it, it's my understanding that the other party would have to prove the violation. That would involve proving that their own copyrighted code predates yours, and presumably convincing a judge or jury that you copied the code, or at least that your code is too similar to their own. It's also my understanding that, as this would be a civil case and not a criminal case, the standard of proof is much lower than the "reasonable doubt" standard in criminal cases. I've never dealt with this sort of situation myself, though, so my knowledge of just what would constitute proof of violation is slim at best. Also, the procedures and details may well be different in Germany than in the US. If you really want to know more about this aspect of it, I suggest you consult a lawyer, or at least perform a Web search.

>> There's also another option: clean-room. If you don't look at the GPL

> a lot of releases to find similarities - obviously.
>
> What can one do in these cases? Not write the software in first place?

If you want to avoid any possible accusation of copyright infringement, that's exactly right. You take the risk of that accusation if you post a 2-line program to a newsgroup. That's one legal risk involved in writing software, just as a malpractice lawsuit is a risk of being a physician or a libel lawsuit is a risk of being a journalist. You may not like it, but it comes with the territory.

> I doubt that GPL violations can
> be stated clear enough, and make it IMHO hard to develop software
> independently without getting at least in a legally mood zone. In principle,
> still someone could look at my code and argue that code parts have been
> stolen from somewhere else. Then I still had to argue whether this applies

> or not. Hence, GPL places potential work and risk on the shoulders of
> authors that do not want to follow GPL to begin with.

IMHO, you're overstating the problem -- perhaps understandably, given your current situation. The same risk exists for other situations, though, and in other fields. A book author can be sued for copyright infringement, for instance, and there's no distinction between source code and object code in that world; every book's "source code" is available. Even commercial software can be disassembled and copied, although that process is extremely tedious for big modern programs. Microsoft has a "shared source" program by which programmers can see at least some of Microsoft's source code, so anybody who uses that program is potentially open to a copyright violation claim under the same terms as somebody who views GPLed code.

> How far does the license go with small things like that?

Asking about the license in this context is the wrong question; the
license can't take away any rights you'd have under copyright law,
although the license can extend your rights. The correct question has
nothing to do with the GPL, but rather with copyright law itself: Does
copyright law allow you to copy that one-line Windows API call? (If the
answer is "no," then you might ask the follow-on question, "does the GPL
give me the right to copy this line that I would not have under copyright
law alone?")

IANAL, but I find it hard to believe that the presence of an API call in
a GPLed program could be used to prevent others from using that API call.
If anything, that call is copyrighted by whoever wrote the API, and is
used in a GPLed program only by virtue of the fact that the copyright
owner granted the right to others to use that call -- say, in a license
for a development library or programming language. Even this may be going
too far, though; I don't know how small an element can be copyrighted, or
the details of how copyright applies to API calls.

Mathy,

Here are some ideas:

1. Unless you are already well versed with assembler, find some good
sources for assembler tutorials, preferable 6502 based. I've seen
these on the web but will have to hunt for the specific URL.

2. Find examples of code snippets that actually do something. I think
DeRe Atari is one good source. It's one thing to learn a language,
and another to learn it in the context of the operating system (Atari)
you are working on.

3. Get a good debugger. I would say better with a 'hardware'
solution, e.g. Omnimon, versus a 'soft' solution like DDT (although
DDT does appear to be very good also).

```
Mathy.
Unless you've done some assembler, you need to
start with the simple stuff. Mac65 is a macro-assembler
and can and has been used for advanced, complex
programming. I don't know beans about macros, but
use Atari Assembler Editor for little ml progs that
I then put into my BASIC programs.
I have the ASMED on my site, along with two
brief introductions to assembler, text files. I never got
beyond simple assembler stuff.
start with say:

10 *=$600
20 L1
30 LDA #$40
40 STA $610
50 JMP L1

That'd be an endless loop, but you could then single
step it in DEBUG and watch the registers and get
used to assembler a little.
To make a .OBJ file you'd type:
(first LIST it to a file:
LIST #D:A1.ASM)
ASM #D:A1.ASM,#E:,#D:A1.OBJ

But first you just type
ASM
and watch it assemble.

You need to learn the addressing modes. Most used
are immediate and absolute, but there are 11 other
addressing modes. immediate is a number:
LDA #$FF
absolute does something to an address.
STA $610.
My most advanced (?) is called indirect indexed.
It allows a use of a two byte address, which comes in
very handy.
indirect indexed uses an address in page zero, indexed
by the Y register. $CB $CC is almost always available.
You store your address, low, high in cb and cc.
Then you can store something indirectly or load a byte
indirectly.
Say you put 00 90 in cb cc. Then you could poke
```

```
from 9000 to 90FF with something like
LDY #$0
L1
LDA #$10
STA ($CB),Y
INY
BNE L1
RTS
This would put 16 in $9000 to $90FF.
But I ramble.
My site is http://my.en.com/~russg
or www.en.com/users/russg
Russg
```

Well,
how can Thomas violate the licence of Atari 800?? Atari 800 does not
have any LEGAL licence, at least not from the copyright holder
(Atari/Infogrames itself!). And since Atari 800 does not have the
(legal/official) right to emulate any Atari related hardware or
software, how can the authors of Atari 800 make complaints about
Thomas?!? Both are violating the copyright laws, the Atari 800 (DOS,
WIN, PLUS, etc.) authors did it in the first place (not asking anyone
for the legal rights to emulate Atari) and Thomas did it thereafter.
meaning both are guilty for the same reasons, thus they should not thow
stones on anyone...

Just think of a thief who steals some items in a warehouse. Now another
thief steals these items from the first. it would be very ridiculous if
the first thief then walks to the police complaining about the
second... -Andreas.

Well,
this means that Darek Mihocka got the rights to use the OS ROMS with his emulator. This does not mean automatically, that every other emulator (or programmer) may freely use these ROMS. Besides, the permission was given for the OS ROMS, this does not automatically include permission to use/emulate all other A8 chips (like Pokey, Antic, GTIA, etc.).

And still, emulators are only "half-legal", since they force the user to use copies or so-called images instead of original software (on disk, tape or cartridge). In many cases, these copies are not legal. Just think of a car that would drive with human blood instead of oil. such a car would force the owner to do something illegal (steal blood from blood banks or kill humans). And thats what I say, emulators partially force their users to do something (normally) illegal... -Andreas.

> stones on anyone...

Your assertion that the Atari800 emulator is illegal doesn't make it so.
As others have pointed out, the emulator requires Atari ROMs. An earlier
emulator author obtained the rights to distribute those ROMs free of
charge, and other Atari 8-bit emulators now rely on that earlier release
by enabling people to use the ROMs distributed with the earlier emulator.

If the claim is about the hardware, that's another matter, of course, and
I can't say that I know precisely what IP protections on the 6502, GTIA,
etc., exist. I do know that emulators in general are very common,
including commercial emulators for far more recent hardware than the Atari
8-bits. For that matter, hardware "clones" of CPUs exist, such as AMD's
line. Given that, I think it's incumbent upon you to back up your
assertion that the original emulator is in some way illegal; the plethora
of hardware and software "clones" suggests that they are not illegal.

Hi all,

Yep, I commented on this back in the middle of 2001 - how could you forget
;-)
http://groups.google.com/groups?hl=en&lr=&ie=UTF-8&selm=rteR6.204%244u1.2384
1%40wards

By "better" I meant a more accurate conversion from the C64.
I miss the snakes snarling, servant cleaning up and aren't the sprites
in the Atari version a little on the chunky side? A 4 colours game is a
bit of a cop-out, the A8 can do better. Finally, the controls are a little
sluggish.

Don't get me wrong, it was nice to see it (it wasn't released officially
though)
but having examined the C64 version prior to seeing the LK Avalon version,
it just didn't meet my expectations. Just me I guess?

As for the A8 doing NES stuff, the core is a 6502 (or variant) and so no
problems
there. Most carts perform some kind of bank switching which XEGS
carts/130XE's
are capable off. The missing part is the graphics 'tile' and sprite
handling, here we have
to do with software based techniques. Also the screen resolution is wider
and so
most screen displays wouldn't fit on the Atari's 160*4 colour pixels,
therefore some
games are suited and others aren't. With FF3 its the 'essence' of the game!

Best Wishes,

Mark

> (or programmer) may freely use these ROMS.

Fundamentally, copyright is about the right to copy (hence the name);
once legally copied, "fair use" doctrine is that you can use the material
in any way you see fit, so long as you don't make further copies. Thus,
when I buy a book, I can read it, give it to a friend, make paper mache
from it, or what have you. Likewise, once I've got a legal copy of a ROM
image, I can use it in any way I like -- including using it with other
software. The files that come in Mihocka's package don't include any sort
of license terms for the ROMs that I could find, so there doesn't appear
to be any provision to change these fair use clauses. Even if there were,
the legality of "shrink-wrap license" provisions that restrict users'
rights beyond those of copyright are debatable at best. In fact, there
was a recent court case in which one such restriction (a limit on the
right of users to publish reviews of the software) was struck down by the
courts.

> Besides, the permission was
> given for the OS ROMS, this does not automatically include permission to
> use/emulate all other A8 chips (like Pokey, Antic, GTIA, etc.).

I'm pretty sure that copyright doesn't apply to chips like that unless
they include microcode. Certainly there are dozens of commercial and
open-source emulators available, but I've not seen a flurry of lawsuits
from CPU or other hardware manufacturers to shut them down. Please
produce precedent to back up your claim that chips like this can be
copyrighted or otherwise require permission from the chips' producers.

> And still, emulators are only "half-legal", since they force the user to
> use copies or so-called images instead of original software (on disk,
> tape or cartridge). In many cases, these copies are not legal.

Incorrect. First, backup copies of computer software are legal. This is
another "fair use" provision of copyright law. Thus, so long as a person
has an original, legal copy of a program, running it on an emulator, from
a copy of the software on a computer's hard disk, is OK. Second, there's
a lot of freeware software for Atari 8-bit systems, and all of that is
legal even if the person makes copies and gives them to friends. Third,
even if people use an emulator to run software for which they have no
license (and I'm quite willing to agree that this does happen), that
doesn't make the emulator itself illegal or "half-legal," any more than

the fact that people run pirated software on real Atari computers makes
the original computers illegal.

There was no mention of any restriction on the use of the ROMs.
Only on the distribution (must be free, must remain as a single ZIP file).

Yes, an Atari 8-bit section is the next that will be added to AtariAge
now that we've got all the game consoles covered. And we'll be adding
8-bit titles to our store even before that section goes online, and I
greatly look forward to any 8-bit homebrew development! The Atari
8-bit computer line is a favorite of mine, as I spent many years
programming them as well as using 8-bit hardware to run a large BBS.
:)

Actually no, about the Atari OS ROM I mean. I seem to recall that Derek publically posted something to the effect he asked for permission for the OS to be *used with his* emulator. Not only his post, one emulator writer posted that Derek told him<harassed?> something to that effect too. Do a google search if you want more info. Derek seemed quite upset that other emulators were using them w/o asking permission from Atari, but then Derek seems to get upset about just about anything. Derek may have his posts noarchive but you will usually pick up his quoted text in other peoples' replies.

If you want a bright spot then you can look up Wes Newell posts. He released a lot of Newell stuff and Omnimon OS may be in there. The ownership of Omnimon is still a bit open for debate and I think Wes may have said as much. Something like David Young<?> still retains some rights or something.

If there was such a condition placed on the use of the ROMs by Atari,
then Derek makes no mention of that condition in his archive, at least
not in any obvious file. As I posted in another message, it's even
unclear that such a provision would be legally enforceable on end users
who never signed a license agreement. Without even a "shrink-wrap"
license file in the archive, legally speaking, the ROM files can be used
by the recipient in any way they choose, according to US copyright law,
so long as the files aren't distributed contrary to the terms that are
specified (that the original zip file must remain intact, etc.).

Now, if Derek signed a contract with Atari that laid out other terms,
quite honestly, that's his problem. If he signed a license that said the
ROMs are to be USED (not just DISTRIBUTED) only with his emulator, he
should simply add those terms to his archive and explain his blunder.
Given that most of the files in the archive have date stamps of March,
1996, it's not like he's not had enough time to correct such a mistake.
Failing that, the only reasonable assumption is that the files are legal
to be used with other emulators, once the original archive is obtained.

> Do a google search if you want more info.

I just did and didn't find anything particularly relevant. If you've got a
specific URL, please feel post it.

I had the chance to work there back in 98. I don't regret not
accepting the offer (read: I'm married now :^) ), but it's
quite sad...

There were some character set editors in Antic and/or
ANALOG. PM editors, I dunno, probably mags also.
What's a map editor? Bit maps of graphics screens,
drawing programs? There was Koala Pad and other
hand drawing tools, but you need to map out a picture,
hand drawing wouldn't work so good.

Ouch. I remember a story with such a car in it. People were literally
dying to get to drive that dream car. But it sucked the blood from the
driver through the pedal. Instead of an engine it had some sort of artificial
heart. The protagonist wasn't interested in such a car, so a rich woman
takes it. "But you know it's going to kill you!" "Yes, I know, but I don't
care."

All the power supplies have a fuse inside them that can be replaced by opening the PS and taking out the burned out fuse, then replace it with a new fuse and your problem just might be solved. I've done it many times and it works..

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

>etc., exist.

AFAIK WDC still manufacture 6502s and hold the IP on it. MOS originally
*patented* its operation and instruction set in 1975 (and licensed Rockwell
etc. to make it) and that is now with WDC too. Emulating the 6502 without
permission is definitely a no-no legally, but it would surely be up to WDC to
raise a civil case, it would not be a criminal issue. Would that put the
Atari800 license in question..?

# 975. Re: Atari 830 Acoustic Coupler Modem, power supply

In the US, patents last for 20 years from the date of filing. For patents
filed prior to 1995, it could also be 17 years from the date of patent
issuance. (See http://www.ip-lawyers.com/faq/length.htm for one
reference.) If this is correct, then any patent filed in 1975 has long
since expired, unless the patent office took over ten years to process
the patent application. Given that the Atari 8-bit computers were released
in the late 1970s (1978, IIRC), any patents on them or their custom
components would also have expired by now.

That said, patent law varies from country to country. It's conceivable
that patents on the 6502 or other Atari 8-bit components are still valid
in some countries. If so, though, and if those patents applied to
emulators (another question), Atari emulators would only be illegal in
those countries.

> Hi Guys, I have a friend that is after a 1200XL, preferably here in
> Australia. They are pretty rare here tho. Any takers?

There's currently an auction running at epay germany. It ends
in ~27 hours and is standing at 101EUR (approx. 110 USD).

http://cgi.ebay.de/ws/eBayISAPI.dll?ViewItem&item=2305578971

so long,

Hias

BTW: I'd also like to have one, but the usual 150-250 EUR they reach
at epay is way too much IMO.

I know this won't wrap right, so I will quote the text.
http://groups.google.com/groups?q=Derek+Emulator+OS+ROM&hl=en&lr=&ie=UTF-8&s
elm=5be665%24lbl%40news.isc.rit.edu&rnum=3
**********
That emulator he's referring to could be mine, or it could be someone
else's, I don't know. But I do know that I'm distributing mine in
source code form, but without the OS ROM's (or BASIC ROM's, or any
other actual Atari software) to avoid legal complications.
Back when I first wrote it, I had a lot of people
(including Derek Mihocka) tell me that it would be illegal to distribute
the ROM with my emulator.
**********

> If there was such a condition placed on the use of the ROMs by Atari,
> then Derek makes no mention of that condition in his archive, at least
> not in any obvious file.

That would be because at the time his was the only emulator so he probably
didn't think it neccessary to say the other emulators can't use his OS ROM
image.
> As I posted in another message, it's even
> unclear that such a provision would be legally enforceable on end users
> who never signed a license agreement.

You have me a bit confused. What are we talking about here then? That
Derek's licence to distribute a ROM image to only used with his emulator is
not enforcable but the GPL licence is? Or are you arguing that the GPL can't
be enforced because the Atari++ authors never signed it?
> Failing that, the only reasonable assumption is that the files are legal
> to be used with other emulators, once the original archive is obtained.

There was more posted on the topic by Derek himself, this was just an easy
one to find because of the noarchive<?> thing. In light of the above quote
it is not even open for question. Derek told emulator writers because of the
deal he had with Atari they couldn't use his ROM images. He directly said
every emulator writer would have to approach Atari and get permission on an
individual basis.

# 979. Super Pac Man prototype question

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-08 20:54:41 UTC
From: Roy G Biv <erasmus@6502.chip.old.folks.home>
Message-ID: <Pine.GSO.4.51.0302081451590.21602@shell1>
Source record: 23491

On 24 Jan 2003 at 18:34:29 -0800, SaTcom2 scribbled:
->The label on mine has the computer printed text "Super Pac Man
->Cartridge 01-19-84"

I've never heard of any "real" production models. I think the closest the Atari Co. got was the version marked "prototype" (which is what mine says). My copy has a white paper label (not metallic silver or brown background like the "regular" production carts) with "SUPER PAC MAN prototype" in blue lettering surrounding a picture of a pacman and a ghost. The chips have a manufacturing date of 1982 on them but I don't see your 01-19-84 date anywhere on the outside or inside.

->The game is very complete, I have played it through the years many
->times, to very high levels.

What are you calling "high"!? The last time I was into this game I got up to board 24 (second pie), but I seem to vaguely remember encountering programming problems in this game. (E.g., the flashing is much worse than in Ms. PacMan.) I'll have to admit that was a decade ago so I don't recall the details.

24th board would be equivalent to 12th key in the original PacMan (where the "Ninth Key Phenomenon" began with board 21 in the arcade game), or board 3 of level 7 on Ms. PacMan (where "The Slows" start with board 21 on the Atari version).

->Anyone have an idea of how valuable this might be, or how many of
->the real ones exist?

As I said, I don't think there are any "real" ones. These "proto-types" may be the only ones ever made. As for value, I don't think they're worth much. E-Bay prices may be 5 or 10 times (or more?) what people here on this base would be willing to sell stuff for. Around these parts I think all this stuff has only sentimental value.

In other words, there's no consistent or large demand anymore for 8-bit stuff, therefore there's no market value worth mentioning. But on the other hand, there's very little competition on the supply side so if a buyer comes along and absolutely *has* to have an item like this one, then the "replacement cost" may be pretty high. That is to say, I may view my prototype cartridge as worth only a few bucks, but you couldn't persuade me to part with it for less than $30 to $40!

Thanks for the help, Russ.

A map editor is a utility to edit game level maps or screens ... ie:
the placement and arrangement of characters and graphics to form a
level map for a game, instead of having to sit and translate pixels
drawn on graph paper into hex and then type in data table. Map editors
are very common around the video game industry, but I don't know of
one for the Atari 8-bit. There has to be one out there somewhere ...

Where would you recommend looking for those magazines ? Are they
available for download online ?

cheers, -d.

I know this doesn't go over well in the ST groups, but wouldn't it
make more sense to just use a cheap motherboard and run Linux
with your emulator of choice? In the emulator you write the hooks
into the underlying OS so you could take advantage of network
cards, higher resolutions, etc all in software, no hardware changes
needed.

Maybe one of these days I'll setup a machine in this way and see how
well it works.

Source record: 23493

On 01 Feb 2003 at 22:20:19 GMT, "Larry White" scribbled:
->I have a surge protector at virtually every outlet in our house --
->The "best" that I have found are from ACE hardware -- about 1500
->Joules + RFI filtering + modem protection for about $16.

In my opinion, if it only cost $16 then it can't be expected to
do much. The word I got from experts many years ago was that a
good surge protector has to have MOVs -- metal oxide varistors --
like, for example, the products that are (or used to be) put out by
American Power Conversion (APC) and which cost anywhere from $30 to
$60. (Or did the last time I looked.)

Several years ago an extremely bad electrical storm fried to a
crisp an APC Surge Arrest power strip that was in those days the only
one I had turned on continuously 24 hours a day. The guts inside
were all melted, but By Golly! it protected my electronic gear from
the surge. I've found APC products to be very high quality and well
worth the investment. (The APC web address is: www dot apcc dot com.)

My motto is: "There's no such thing as too much surge protection!"
And don't forget the phone line: there are surges on the phone line,
too!

> the ROM with my emulator.
> ********************************

This is a post from somebody named Frank Barrus, and it doesn't
contradict anything I've said. In the post, Frank is saying that
DISTRIBUTING the ROMs with other emulators is illegal, not that USING the
ROMs with other emulators is illegal.

>> If there was such a condition placed on the use of the ROMs by Atari,
>> then Derek makes no mention of that condition in his archive, at least
>> not in any obvious file.
>
> That would be because at the time his was the only emulator so he probably
> didn't think it neccessary to say the other emulators can't use his OS ROM
> image.

Hypothetically, if Atari placed that condition on distribution of the
ROMs, then Derek should have passed on that condition in his own license,
even if there were no other 8-bit emulators at the time. Failure to do so
would be negligent on his part. What's more, if such a condition existed
and Derek did mistakenly omit mention of it, he's had plenty of time to
correct the mistake. He still makes a file without mention of that
condition available on his Web site, though. It's not like that file is
written in stone; as the author, he can legally change it. (Unless
perhaps Atari approved the entire zip file, in which case Atari

effectively didn't enforce any conditions on its distribution beyond
those mentioned in the file.)

If Atari didn't place that condition on distribution of the ROM images
because they didn't think of the possibility, then so what? The terms are
what the terms are, whether Atari thought of all the consequences or not.
Unless and until somebody produces something more definitive about the
original terms, it appears to be 100% legal to use the ROMs with other
emulators, so long as the ROMs were obtained via an unaltered Xformer
archive.

>> As I posted in another message, it's even
>> unclear that such a provision would be legally enforceable on end users
>> who never signed a license agreement.
>
> You have me a bit confused. What are we talking about here then? That
> Derek's licence to distribute a ROM image to only used with his emulator is
> not enforcable but the GPL licence is? Or are you arguing that the GPL can't
> be enforced because the Atari++ authors never signed it?

Copyright law grants certain rights to those who receive copyrighted
material in a legal manner (for instance, people who download Derek's
Xformer emulator). Those rights include the right to use the files in
more-or-less any way the users see fit, so long as they don't make
further copies. Thus, copyright law grants the implicit right to use the
ROM files with software other than that included in the archive.

A hypothetical license term restricting use of the ROM files with other
software would be an additional restriction, above and beyond those
imposed by copyright law. Normally, such an additional restriction
requires a signed contract; the legality of "shrink-wrap license"
restrictions has, to the best of my knowledge, never been fully tested in
court, although I'm aware of one recent case in which such a restriction
was struck down. (Namely, a software vendor included a provision that
users could not write reviews of the software without prior consent. The
courts ruled against the software vendor.) The enforceability of such a
restriction would be even more dubious given the fact that the end users
never saw it.

The GPL, OTOH, removes restrictions of copyright law. Users can do many
things with GPLed software that they can't do under copyright law alone,
such as make unlimited copies the software, modify the software, etc. The
GPL doesn't impose any restrictions on use beyond those of copyright law.
(The condition that modifications be made available under the GPL isn't a
new restriction, since modifications are completely illegal under "raw"
copyright law.) This is fundamentally different from a restriction on
fair use of a copyrighted work, as is more typical of "shrink-wrap
license" terms, such as the one against writing reviews that was struck
down or the one against using the ROM images from the Xformer zip file
with other software that's not even mentioned in the Xformer zip file.
Even if the GPL were struck down in courts, the result would be "raw"
copyright law, which grants even fewer rights. Anybody violating the terms

of the GPL would be subject to whatever penalties are applicable for
copying a work under copyright law generally.

>> Failing that, the only reasonable assumption is that the files are legal
>> to be used with other emulators, once the original archive is obtained.

> individual basis.

The bit you quoted does *NOT* say that; it says that others may not
DISTRIBUTE the ROMs WITH THEIR EMULATORS. There is a **BIG** difference
between those two statements. To the extent that this "is not even open
for question," it's a matter of use of the ROMs with other emulators being
legal, so long as they're obtained from Derek's archive -- the position
I've taken all along. You've presented no evidence to the contrary.

## 986. unbelievable.....

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-08 23:28:49 UTC
From: magex@bellsouth.net
Message-ID: <3e458cbb.638722343@newsgroups.bellsouth.net>
Source record: 23498

I'm normally not a newsgroup reader, and I normally just lurk in the newsgroups (even mail lists that I am subscribed to). However, the recent surge of controversy over the Atari800 and Atari++ projects got my attention. I normally skim messages, but I say down and pretty much read every word of every post. I am not a professional programmer, but I code for hobby. I have never taken even the general idea of someone else's code, written my own code module, and claimed it as my own. Even when I've converted PASCAL code to C, I credit the original PASCAL author. Taking C source and making it C++ is nowhere near that drastic a change, so the claim that Atari++ isn't even the same language (though, in my opinion, they are) doesn't dismiss the fact that the new code was at least inspired by someone else's work. C and C++ code can be formatted several different ways. Many code blocks can be written in numerous ways, resulting in the exact same output. As far as variable names, I know that I generally use my own variable names when I convert/rewrite someone else's work, yet they still get credit for the start.

That brings me to the whole OS ROM issue that's been brought up. As far as I know, anyone that owns (working or not) the original hardware/product has the right to use copies of any ROM data for personal use. Meaning, all the ROM files I use with my Atari emulators were taken from my Atari 130XE (or the dead 800XL). I'm willing to bet that a good number of those writing the code for these emulators also have the real machine. It's hard to know if the code does the correct job if there's no genuine machine to compare it to. So, the "legality" of the emulator isn't really in question. What get's in question is the legality of the various users to RUN the emulator.

I'm done for now.

> > contradict anything I've said. In the post, Frank is saying that
> > DISTRIBUTING the ROMs with other emulators is illegal, not that USING the
> > ROMs with other emulators is illegal.

From your 2/7 11:54 post.
"Your assertion that the Atari800 emulator is illegal doesn't make it so.
As others have pointed out, the emulator requires Atari ROMs. An earlier
emulator author obtained the rights to distribute those ROMs free of
charge, and other Atari 8-bit emulators now rely on that earlier release
by enabling people to use the ROMs distributed with the earlier emulator."

2/7 1:24
"Fundamentally, copyright is about the right to copy (hence the name);
once legally copied, "fair use" doctrine is that you can use the material
in any way you see fit, so long as you don't make further copies. Thus,
when I buy a book, I can read it, give it to a friend, make paper mache
from it, or what have you."

"Likewise, once I've got a legal copy of a ROM
image, I can use it in any way I like -- including using it with other
software."

"The files that come in Mihocka's package don't include any sort
of license terms for the ROMs that I could find, so there doesn't appear
to be any provision to change these fair use clauses."

These are clearly in conflict with what Derek said his agreement was. The
last part was handled by Derek in public posts and via emails.

I think we have a fundamental difference on what fair use is. I was under
the impression that copies are only OK when used for education, parody, or
for personal backup. That is you could make a backup copy of Xformer
software including the ROMs for instance. We will probably have to leave
that one behind unless you can provide a source that supports your position.
<snip>
> Hypothetically, if Atari placed that condition on distribution of the
> ROMs, then Derek should have passed on that condition in his own license,

Very true, but irrelevant. A lot of what I snipped below is irrelevant too.
The argument seems to be 'since Derek forgot to mention it, it makes them
fair game' just don't seem right. He did correct the mistake by public posts
and a warning to at least one emulator writer.

It would be like using the argument that since Thomas Richter didn't mention
the GPL, we can all now ignore it.
<snip>
> A hypothetical license term restricting use of the ROM files with other
> software would be an additional restriction, above and beyond those
> imposed by copyright law.

Hypothetically we only have Derek's word that he obtained permission to use
the OS. Hypothetically he may have presented a distorted view of what his
licence was to keep other people from developing emulators.

What we do know is he said he got permission and it was on the condition
that they only be used with his emulator.
<snip>
> The bit you quoted does *NOT* say that; it says that others may not
> DISTRIBUTE the ROMs WITH THEIR EMULATORS. There is a **BIG** difference

Nope, irrelevant argument. The exact opposite is true when it comes to
copyright law: Everything is assumed to be copyrighted unless you have
specific information to the contrary. It is not anyones responsibilty to
show that the material is copyrighted. It is the responsibility of the
people saying there exists a release of rights to document it.

> between those two statements. To the extent that this "is not even open
> for question," it's a matter of use of the ROMs with other emulators being
> legal, so long as they're obtained from Derek's archive -- the position
> I've taken all along. You've presented no evidence to the contrary.

Look, you are confused. I have provided evidence by way of personal memory and a post from another emulator writer. So far you have provided nothing but some odd interpretations of copyright and fair use laws.

Time for you to put up or shut up. Email Derek or something and bring something to the table.

> copyright law: Everything is assumed to be copyrighted unless you have
> specific information to the contrary.

****I NEVER SAID THE ROMS WEREN'T COPYRIGHTED!!!!****

I said that once a user has the ROMs, as legally distributed via Derek's
emulator, that user may use those ROMs however s/he sees fit, providing
that use doesn't violate copyright law or any agreed license terms.

Using the ROMs with an emulator other than Derek's does not constitute
creating additional copies of the ROMs. (At least, not from a copyright
law perspective -- loading a program into memory is explicitly allowed as
fair use.) Thus, copyright law doesn't prohibit this action any more than
it prohibits my cutting a page from one book and pasting it into another
book, provided I own both of those books.

License terms don't seem to apply, since Derek's archive file doesn't
mention any restrictions on how the emulator or the ROM files may be
used, except to say that the archive is freely available but must not be
distributed in modified form. That does not mean that the files aren't
copyrighted; it means that there's been no apparent attempt to impose
additional terms on the use of those files above and beyond those of

copyright law. You keep claiming that Derek imposed additional terms, but you can't seem to produce a reference, and the one reference you did produce didn't say what you claimed it said. Thus, I can't take your claim that Derek said the ROMs could not be used with other emulators very seriously.

Copying and use are very different things. Note that I'm talking primarily about "use" in a colloquial sense, not "fair use," which has an explicit legal meaning that deals with copying or creating derivative works -- for instance, parodying a work or using it in education. In this sense, "use" has more in common with what's known legally as the "doctrine of first sale," which basically says that a copyright holder has no say over what I do with my copy of a work once I've received it.

> Look, you are confused. I have provided evidence by way of personal memory
> and a post from another emulator writer. So far you have provided nothing
> but some odd interpretations of copyright and fair use laws.

No, you're confused. You're misrepresenting my arguments and misinterpreting others' posts you found on Google Groups. Copying and use are two different issues, and you can't seem to separate them in your arguments or in interpreting others' posts. Unless and until you can do so, I don't see the point in continuing this debate.

Look for a product called Envision, which was (I believe) an Antic Magazine program. It is a character set editor and map editor using those modified character sets. There is a PC version of the Envision software too.

I don't know of any PM graphics editors though. As for generic level editors, I don't think you will find any particularly... most would be part of a game, like the level editor of Lode Runner for instance.

Well you really weren't able to give a good debate which makes it pointless
for me too. I mean your position ~because Derek didn't put a disclaimer in
his distribution somehow forfieted Atari's rights is classic.

It is also classic faux debate technique on three levels, 1) Shifting the
Burden of Proof, 2) Ask your opponet to prove a negative i.e. prove the Loch
Ness monster does not exist otherwise it does, and 3) Trying to set up a
straw man i.e. I misquoted you when the quotes were verbatim from your
posts. You really aren't up to this.

Well, most posts are definately not "professional". Then again, most
flamewars are not made in the name of business. So it's not quite the
same :) Your idea is certainly preferable to the current MO. A 2 line
post with a descriptor and URL is far better than 250 lines of the same
junk once or more a week.

This is a regional issue. Here in the U.S., you'd have to be daft to
blindly send cash money around, uninsured, in just the "general post".
The sender or recipient are not the problem, the USPS employees are.

I never got Analog Computing so I can't say. Is BXE different than
DDT which my MAC/65 had?

If you want to learn assembly language (which is what MAC/65 is--an
assembler), there are a few things to understand. First, YOU NEED A
BOOK DESCRIBING OPERATING SYSTEM CALLS; I recommend "Mapping the
Atari", but I don't know if it is still available in PDF form or in
print. Second, you need a book on the 6502; the 6502 is still used
and sold, so finding literature here should be trivial with a google
search. Please understand that while assembly language is more
powerful and can be thousands of times faster than BASIC, it is more
difficult to program even the simplest expressions. BASIC itself was
written in assembly language. Without knowing the address and how to
set up an operating system call, you can't even get input from the
keyboard or send a message to the screen. If you study the 6502, you
will note that there is nothing there that has anything to do with a
keyboard or screen. All you can do is manipulate memory addresses and
make calls to memory addresses. So, you need to know what memory
addresses you can place your program in, what memory addresses to use
for setting up a request from input from the keyboard, what memory
address calls the operating system and requesting something done. My
point here is that assembly language programming doesn't have the
conveniences of BASIC where you have a print statement and an input
statement, file opening and closing, etc. All this is done by knowing
the memory addresses for setting up a call to the operating system.
Hey, even comparing two numbers to see which one is larger is no
trivial task.

From: Marius Diepenhorst <grover25@zonnet.nl>
Message-ID: <b24t8n$e1h$1@reader08.wxs.nl>
Source record: 23505

Hi

A few weeks I ago I made a very little tool that formats (without any security questions!!!!!!!!!) a 16mb partition that is stored in D2:

I had to make this thing for MyIDE because MyIDE soft version doesn't support spartados, and btw. you can't use the fmtdir software with MyIDE neither.

The label of the created partition is "MyIDE" and I don't know if it's possible to change that after it. (With a sector editor it can ofcourse)

Again i have to say:

ths little tool was made for my own use, so i didn't make any security questions in it, and it only works on (d2)... I have another version, that formats d1. the partition has to be 65535 sectors double density.

Interested? Mail me: grover25@zonnet.nl

Greetz.

Ah, excellent child, prove my point for me. People take extreme standpoints all the time, but they normally do it without insulting and name calling. Apparently you can't do the former without doing the latter. And what would you say the definition of someone who insults people without being "serious" about the insults or the argument under way? Sounds like "childish" to me. And lo and behold if you don't end with another personal insult! I just love it when your type fall all over themselves to prove my accusations correct. Goodbye child.

## 995. Translator Disk

Atari's rights were never forfeited. They gave him permission to distribute
their ROMS. They did NOT specify any specific restrictions on the *use* of
those ROMS. That was their mistake, unless they deliberately decided not to
put any restrictions on them, which would imply they considered it ok for
other emulators to use the ROMS too. It is incumbent upon the licenser to
make sure all restrictions it wants are specified in the license, otherwise
the normal rules apply, this is why licenses and EULAs have become so absurd.
Now if they had intended for those ROMS to be used only for XFormer, I
figure it would have taken less than a week for Atari to have the XFormer
distribution taken down and a new license for the ROMS added to it. That they
didn't tells me they weren't concerned, and that Derek complained about it
just tells me he wanted to have the only emulator with the official ROMS. If
what you are suggesting was true, Derek could have gone back to Atari, told
them what was happening and had them give him a new license agreement for the
ROMS. This never happened. So, not only is Rod's point correct that Atari's
"rights" were not violated by other emulators referring their users to the
XFormer distribution to get the ROMS, but as a practical matter, Atari also
seemed unconcerned about this "problem" since they did or said nothing about it.

Disclaimer: IANAL

If you want a better answer try in gnu.misc.discuss. But my answer is this is not a problem. Once you get down to the point where there is little room for expressiveness, i.e. there is only a small number of ways to accomplish your task, it becomes impossible to prove copying versus independent creation. In your case, using GPL'd code to find out how to use an API call isn't copying, you're just using the GPL'd code to help you learn the API of whatever it is you are programming on. As a technical matter there is no rule of thumb saying "x number of lines is copying", every case comes down to the specifics of that case, and the only ones who can say anything definitive on that are the lawyers who worked on the cases that actually ended up in a court. Maybe someone on gnu.misc,discuss knows about such cases if there are any. As a practical matter however, it would be impossible to prove copying versus independent creation on one line of code which is just an API call.

Think you are referring to a comment I made here. I was pretty much kidding here since most C code is also C++ code. But Atari++ is considerably more than taking the code and building under a C++ compiler.

Anyway interesting to hear from a lurker (I normally am -> the Atari++ drew me out too...):-)

Mark

P.S. If this turns into another Uber Atari++ thread of Doom I will be most displeased;-)

Show me the permission they gave. Another put up or shut up challenge. You and Rod are both spouting off about how this permission forfieted Atari's rights, let me see your copy. I say it has never been publically disclosed therefore anything you guys have to say about its contents vis a vis "restrictions" are imagined.

Not trying to be particularily difficult, but you have to prove your statement. Seriously I would like to see it. There are probably at least a dozen people still in the newsgroup<and the ST group for that matter> that remember Derek's posts saying ~Atari only granted the "specific " rights for the ROMs to be used "exclusively" with his emulator. It was his position ~every emulator should get this same permission. I mean we still have proof via google. This was from the horses mouth so to speak.

AFAIK Derek is the only one who knows what the full context and content of the agreement was. I never saw him disclose any letters or email from Atari. I just checked the current Xformer distribution and there are none in there either.

Just for the record, Thomas's position ~since the emulator writers have a lax attitude for the Atari/Xformer license gives him some kind of entitlement is not particularily strong either. It is the old 'two wrongs don't make a right' type argument. He does have a point though when people are presenting their position as the high moral ground.

I've done it, but only for international software purchases. It worked out
okay.

Mark
PS: Sean I agree with every point you've made.

# 1004. Formatting HD w/ SpartaDOS on Atari800Win

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-09 18:02:14 UTC
From: Jeffrey Loomis <jloomis2k@hotmail.com>
Message-ID: <yUOdnXKgZ7tNCtujXTWcpQ@comcast.com>
Source record: 23517

I having trouble formatting HD images with SpartaDOS. I keep getting
??Shows Multiple Tracks??

I am running Atari800Win Plus 3.1. I'm booting to SpartaDOS 3.2f. I have
created various atari disk images (using the emulator) ranging from 32767 to
65535 sectors (128 bytes each). Then using the emulator I point D3 to one
of these newly created images. If I run the Dir command I get 000 free
sectors.

Then I run hdinit, specify drive 3, a volume name and answer yes to
initialize are you sure. Then I get ??Shows Multiple Tracks?? and am
returned to the prompt.

I am able to successfully format and use these large images in MyDOS 4.5.
Just not with SpartaDOS.

Any suggestions?

Thanks,

Jeffrey

Sparta 3.2f? 3.3a is supposed to work better with
emulators.
But with a800win, you can even try the SpX cart.
SpX is really better for hard drives maybe.
A real hard drive, you have to do hdfmtph6 or 8.
And, WAIT... ok, go ahead. And you have to
Do a hdfmtdir or something like that to write the
directory to a real hard drive. I think only SpX
can write the directory of a hd, otherwise you have
to use the Sparta utility to do it.
Russ

There's translator A and B, you probably want the
B one.

# 1007. Question: MicroDOS for BASIC

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-09 22:07:29 UTC
From: Carsten Strotmann <cas_news@strotmann.de>
Message-ID: <b26j6r$19bm7c$1@ID-174234.news.dfncis.de>
Source record: 23520

Hello,

I'm currently converting an old cassette game to disk for a friend on mine. It's a plain ATARI Basic Programm in two Parts, Part 1 initializes a new Charset and then loads Part 2.

Unfortunatly Part 2 uses almost all Memory available. When loading from Cassette, this is not a problem, because there is no Dos in memory.

In the Disk-Version, a normal DOS (Sparta, MyDOS, Atari-Dos ...) uses too much memory, so I get an Error 2 when loading the 2nd part of the game.

I tried several Micro-Dos, but almost all don't support the BASIC "RUN <filename>" command.

All "normal" Dos Versions are too big.

Can anyone point me towards a solution, maybe a Micro DOS out there that supports BASIC Load/Run Command or a "normal" DOS with very low memory foodprint.

Best regards

Carsten

Unfortunately, the GPL doesn't state that you may use one line of GPL code
and have it not affect the project. In this post and others you have hinted
at the fact that you have looked at the original code and used part of it
in a++. This is a definate GPL violation.

Modified and derived are the same. My view is the only way you could
use GPL code and not be in violation is to use some sort of clean room
technique.

It doesn't matter if you copy and pasted or re-typed making modifications,
it is still a GPL violation.

I'm glad to see that you are getting this worked out, and hope
that everything will be ok in the end.

I'm not sure it was your comment that was on my mind when I wrote that
or not. I just recalled someone saying something about Atari++ being
a different language than Atari800.

I know what you mean. It's great to see another Atari emulator. And
I've seen nothing wrong with the license on Atari++, except that it
seems to be in violation of another license that was used for code it
was based on or inspired by. The initial "project closed" reaction
was not a good thing and suggested to me that something was found out
that wasn't expected to be. But, enough of that.

That was a "bug" that I fixed in my own copy. Regardless of the size,
Atari800 treats all disk images as floppy drives and reports them as
such in the SIO status. I'd added a flag to the ATR header that
selected with SIO status code to use. Ok, so it wasn't really a bug,
but it was an oversight that has remained in the code. Maybe I should
submit a patch up to Petr. I'm already thinking of sending in a
replacement diskled.c module (35 bytes per character definition? come
on, guys...7 bytes is enough).

<snip>

My favorite game on the Atari in this genre is Zybex. Of course,
yes, I agree we need more like this.

In the 3D realm of shoot-em-ups, the Space Harrier clone being worked on
looks _awesome!_

Probably my most played game from ~1984-1995 was Rogue. I had both the PD and Epyx versions.

There was a version written in BASIC for the Atari. It was really not very good.

FreeCell has replaced Rogue for my 'goto program' while I am waiting for my S.O. to get ready to go out or the coffee to finish brewing.

I have some ideas on what I'd like to do. FPP step movement like Dungeon Master on the ST with very limited graphics. Probably make it so you never win just like the real Rogue, you only try to set high scores.

I know I still have an Action! cart around here somewhere. I just have to put together a working system and hope my S.O. doesn't dump it in the trash.

How would I go about fixing that in my copy? I'm a VB programmer so this c
stuff unfamiliar to me. Do I have to wait until Atari800 is updated and
then for the next version of Atari800Win to be based on the Atari800 update
? Can I hex edit the ATR image file to get around this?

Thanks,

Jeffrey

# 1014. Re: Question: MicroDOS for BASIC

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-10 04:15:02 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <aHF1a.8582$tO2.825078@newsread1.prod.itd.earthlink.net>
Source record: 23527

Compute! printed a so-called MicroDos which was a small replacement for most
of Dup.Sys; it still required the file management system with the standard
lomem value.

Most other MicroDoses are actually binary loaders which do not support
Basic. They could be used only if you:
1 add vectors to charset file for its load location,
2 extract pointers from .BAS file,
3 add vectors to load .BAS file at $800 or lomem + $100,
4 create file to set Basic pointers & lomem,
5 append three files together
6 set run vector to Run Program point in Basic cart - may include this in #4
7 put this new file on disk with loader

Variations could let it load and drop into Basic for you to issue the RUN
command or make it a boot disk with just your Basic data and no loader. The
only other option is writing your own SIO routines to retrieve disk data
without Dos.

Ah, the one that never was ported to the A8: Skyfox.

Then there's Gunship, which *was* released for the A8 but apparenty only
very few people have seen a working copy of it (including myself).

What I've never seen on the A8 is some racing game in 1st person perspective,
either.

> I just checked the current Xformer distribution and there are none in there
> either.

I'm just pointing out that if Derek's statements were true, Atari must not
have not considered the matter important because *they* never got involved.
Did ANYONE get a threating letter from an Atari lawyer? Did an Atari
representative get on the newsgroup and explain their position? All we have
is Derek saying the ROMS can only be used with *his* emulator, but he never
proves that either. Think, if this was true, why didn't Derek add an

appropriate license to the XFormer distribution? He complains but never does anything to stop it, nor does Atari itself do anything? In this case, your 'horse's mouth" doesn't have any evidence to back itself up. What if Atari didn't care if all emulators used their ROMs? That would explain why they didn't get involved, and why Derek complained publicly yet never changed the license. All that matters is the law and the licenses involved. The license was never changed, no specific restrictions were placed on the ROMs's use, and the law doesn't specifically forbid this use, ergo, its legal.

> Just for the record, Thomas's position ~since the emulator writers have a
> lax attitude for the Atari/Xformer license gives him some kind of
> entitlement is not particularily strong either. It is the old 'two wrongs
> don't make a right' type argument. He does have a point though when people
> are presenting their position as the high moral ground.

The allegation is that he stole their code. The A8 developers didn't steal any Atari code, they don't even distribute the ROMs with their emulator. I hardly see an equivalency here. Besides, if you do think it is theft, how come Atari never yelled "Stop, thief!"?

There's a neat little puzzle game for the Sharp Zaurus called
"Tickypip", which is apparently a clone of some PalmOS game called
"Netwalk" or "Netawalk" or something.

It's a little puzzle game where you must rotate little chunks of
network cable until every computer in the grid is connected to the main
server.

I think this will be my next little contribution to the Atari 8-bit. :^)
(With luck, I'll be able to get the game to use game files from the PalmOS
game; Tickypip on the Zaurus uses them just fine.)

Well, a lot of people (myself included, most of the time) would feel a lot better using a computer that's more closely related (hardware-wise) to the machines of yore that we love so much as opposed to an emulator, disk images, etc.

I've lost a lot of interest in the Amiga and ST online communities these last few years watching them arguing back and forth about who has a better Amiga/ST; the ones with the high-speed PC running LINUX/Windoze and an emulator or the people with the genuine Atari/Amiga hardware and $2000 into their system.

IMHO this is just another area where computers are strikingly similar to automobiles: the more money and hardware you dump into them, the more they require. The further you get from stock, the less dependable things become.

In case any of you are wondering, I have C=64s, an 800XL, an Apple ][+ and a CoCo2, all of which run 64K of RAM at 1MHz (save for the Atari, of course) and they all run wonderfully! :^)

# 1021. Borland modula-2 for atari 5200?

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-10 12:54:58 UTC
From: google@runtime.demon.co.uk
Message-ID: <6210f8f8.0302100454.2d3684ed@posting.google.com>
Source record: 23534

I got an email from Borland today about the 20th aniversary of borland Pascal. I had a request to fill out one of those silly marketing questionaires. In a moment of weekness I went to the site to fill it in.

Any way, part of the questionaire is a list of all the products Borland and made over the years and if you have used them or not. One item struck my eye, 'Turbo Modula-2 Atari 5200'.

Any one ever seen that? I cannot see ANY modula-2 listed on the faq.

The site url is

http://whatever.borland.com/bdnsurvey.html

But it don't say a lot.

I cannot find any reference to the product in the Borland museum site.
I have dropped them (borland) a line asking if the package could be made available. I wait to see what answer I get back.

I suspect that should have been 520. In its early days the ST had quite a
few big names developing for it including WordPerfect, Microsoft, Lotus
etc

Some days ago I was really shocked when I read that GPL violation and
lawsuit and theft mails in the Atari800 newsgroup, and now this
newsgroup is full of it too. I can't even start to imagine that people
that share the same hobby are talking to each other that way.

I have to say that now I'm happy that due to pure chance I did not
yet submit some of the things I coded to the Atari800 project.
At no time I was aware that being a lawyer ( or at least paying one )
is a prerequisite to sharing code I've written with others.

In my spare time I am coding for fun, and I think the others have
done so too before they somehow forgot about that.

Hi,

I am sure there was a version(s) of modula-2 for the 520ST, but from who
I cannot recall. Shot off an e-mail asking if that was a typo, it
almost certainly has to be. Otherwise it appears they released modula-2
for the 5200 game system? ;o)

A lawyer is not required. What is required is that when you use
another's code, you abide by the terms under which they release it.
You are entirely free to release your own code under whatever license
you see fit (or none at all), but it is important that you respect
other's choices in the matter- especially if you wish them to respect
yours. If you are unwilling to abide by the terms of the license,
then simply do not use or include the code.

If you want to craft a license to suit your own preferences, you'd
better consult a lawyer in any case. In a number of areas of law you
will not be considered competent to represent yourself without
considerable legal training.

What amazes me most at these discussions is that everybody seems to
be concerned about laws and licenses but nobody thinks the least bit
about the situation we have here.
For me the idea that one doesn't like to create something in his
spare time, giving it away for free, but wanting to be credited for
it is perfectly understandable. I also understand when this someone
does not like others to earn money with his work. But I don't
understand fighting another one who also creates something in
his spare time and gives it away for free. They should learn from
each other and not fight !
And thinking it through, what would have happened if Thomas had
not made his sources available : he would have had no troubles
and nobody would have had the chance to learn from them !
So all this fuss reads like a big sign to me saying : "don't give
away your sources then you can't get into troubles !"
This can't be what GPL intended and not what anybody here wants ?!

The problem is that what Thomas did is perceived as theft. The Atari800
developers don't mind him using their code, but they want to be credited
when this happens and they expect future developers to honor their own
conditions for redistribution. The GPL was created specifically to ensure
that nobody could legally appropriate GPLed code for proprietary
purposes. Thomas's license is far from the worse in this respect, but
it's not acceptable to GPL developers. That's all that needs to be said,
IMHO, on this topic. The rest is up to Thomas and the Atari800
developers. A topic that's more open to debate is whether Thomas actually
created a derivative work or just used the same algorithms, as he claims.

> And thinking it through, what would have happened if Thomas had
> not made his sources available : he would have had no troubles
> and nobody would have had the chance to learn from them !

Not necessarily. Check this out:

http://lkml.org/archive/2003/2/7/55/index.html

There's also a discussion on Slashdot:

http://slashdot.org/article.pl?sid=03/02/07/2225224&mode=thread&tid=117&tid=106

Summary: Somebody found "fingerprints" of the Linux kernel in a commercial
product that was released without source code, strongly suggesting that
they stole kernel code for their product. There's now quite a stink about
this, but it's still pretty early in the story. I seem to recall hearing
about other cases of commercial products that have been caught with GPLed
code in them. AFAIK, these cases have always been settled out of court.

Of course, chances are people wouldn't have studied Thomas's binaries very
closely, but you never know....

Source record: 23546

Hi, there is a difference between the 800XL and the 1200XL, namely
that the 1200XL OS revision was buggy compared to the 800XL, but since
the 1200XL keyboard is so much nicer than the 800XL, many people buy
1200XL's and pop in the 800XL chips. There are many applications and
games out there that crash with 1200XL chips, and swapping out the
ROMs works.

I remember it clearly. You had to guide the shuttle into orbit keeping it on track all the way to insertion. Then you had to dock with satellites with each one being tougher than the last. You learned how to be most efficient with your fuel or else you wouldn't have enough to get home. It didn't require you to flip the shuttle upside down, but it DID require you to flip the shuttle backwards to use your main engines to slow you down so you could re-enter the atmosphere. Then you had to flip it around forward and had to actually guide the shuttle down the glide path. It would be clouds and stuff and then they would clear and you would see the landing strip. Then you would have to land the thing.

Hehe... Even if they DID mean "5200" and not "520(ST)", it'd be much more
likely that there was some modula-2 that build code _for_ the 5200;
not that ran _on_ the 5200.

(Then again, it's more or less an 800 under the hood, so...)

:^)

My brother had that. It was a neat game. I doubt I'd enjoy it much
these days (I have a very low attention span; you should see me playing
2600 games; constantly popping carts in and out).

Impossible Mission /was/ made for the Atari 7800. (Did it speak?
I'm sure it did. It wouldn't be the same without it! :^) )

Google found this nice photo:

http://www.brooklynboysgames.com/7800/Impossible_Mission.jpg

It doesn't look like it was made for the Atari 8-bit [*], though. :^(

What statements? You already said you were not able to find them via a google search. You stated there are none in the Xformer distribution. I'll admit my memory 10 years later is a bit foggy at best since I can't make direct quotes of their content.

I have been around the Atari scene for quite a while, certainly a longer then the Xformer emulator. I have never seen a copy of the licence Derek got. AFAIK no one else has seen a copy of the license Derek got.

Since no one other then Derek knows the content and context of the license, everything anyone<me too> says about its content is nothing but speculation. Taking Derek to be credible when he says he got permission to use the OS but not credible when he said other emulator writers need to get permission to use it is self serving.

Which is the relativity argument Thomas was making. It isn't a winning argument, but it is a point. AFAIK none of the emulator writers have ever bothered to ask for permission and no one can produce documentation of any kind.

That's it for me, I am gone from this argument. It doesn't even qualify as a debate w/o factual basis for claims like a copy of the license. I am reduced to pointing out flaws in logic.

I think you meant compared to the 800/400 and fewer functions then the XL.
It really wasn't so much the XL and XE OS were buggy so much as people used
illegal calls to code in the original OS. Everything I have that ran on an
800XL ran just fine on my 1200XL.

The 1200XL does lack built in BASIC of course which made it less attractive
for some people. It also lacked the PBI and OS code to run one. Bob Wooley
did a PBI for the 1200XL which required the 800XL code and 800XL/130XE PROM
to get functionality.

You are entirely free to sell GPL work- the only requirement is you cannot prevent your users from having the same rights to the GPL sourcecode that you have. Naturally, this means you cannot put fiscal barriers in front of access to the software. Of course, this is not a good receipe for a conventional software business, but it has its applications and tends to generate a very open and responsive user community that tends to pool its efforts in improving the code.

By taking GPL code and restricting other's use of it beyond what the GPL mandates, the GPL is violated. It doesn't matter if money changes hands or not. This whole exercise could well have been avoided if the code in question was separated out into a different file, kept under GPL, and proper credit given to the original authors. A fanatical application of the GPL might find fault with such an arrangement, but it would take care of the important issues on both sides I think.

If the sources were not made available, he would still be in violation of the GPL (assuming the sources were in fact GPL, unless I've missed it, Thomas has not publicly spoken to that point yet). Again, there is nothing preventing anyone from using GPL code PROVIDED they do not take away the privileges granted to any other user by the GPL.

Yes, it is unfortunate that things like the GPL are necessary but I would like to remind you that the authors of the code are just as entitled to their preferences in how its used and distributed as Thomas is about his.

This rules! :^)

BTW, I'm thinking of getting a MyDOS cart, too. What version is on
there, though? (I prefer 4.53/4, specifically)

Thanks! :^)

I have a copy of this for the Atari ST. I can see why Nintendo
wanted it off the market.

Ok, so I'm of course going to use my 'Super IRG' mode for the graphics,
so squeeze a few more colors out of the Atari.

Here's a mock-up of what I think it will look like, more or less:

http://www.sonic.net/~nbs/tickypip-mockup.png

I put some notes on there, so of course none of that text will be there
(and wouldn't look quite like that anyway :^) )

I don't blame ya.
Derek, unlike some of the others is still reachable. Why don't someone
just have Derek make a statement? Perhaps on his site, as anyone could post
here pretending to be someone else.

Not that I care one way or the other, but since part of the arguement has
spun off into a ROM issue... why speculate? Just ask Derek.
If you are on the side that thinks the ROMs are illegal to begin with
then go to the source, and be done with it.

Hi Folks,
The original adapter is a Novation AC Adapter
Model # 901017
Input 117 VAC 60 HZ 15 Watts
Output 20 Volts AC, 400 milliamps
Since the output is AC you don't need to worry about pin polarity.

Hope that helps

I guess that all depends on how many users request the update. It's
really quite simple. Of course, my experience with the CVS code
hasn't been too good. So, until that's all fixed up, I wouldn't go
asking for more new things.

OK, I guess it's time for another lurker to chime in. I've been reading this for quite awhile too, and have thought about making a comment, but have been biting my tongue. But......

I actually can't believe the discussions that have went on here. Frankly, I would expect some of the comments to come from children, not adults in a tight knit community (That includes the four letter words, etc...).

We could argue about licenses till hell frezees over, but most people miss the point. I doubt we would have ever had the argument about licenses if those creating atari++ had simply credited the authors of code they used. Someone created something, worked hard for it, and simply wishes their work acknowledged. That's COMMON COURTESY, but not much of that exists in the world today. Obviously it's lacking in some members of a community that looks back on the "good old days".

I'm the author of Atari800MacX. It's a port of Atari800, and yes, I credited the authors of Atari800. If I were to have written the original software, I probably wouldn't have picked the GPL, as I'm not a big fan of it. BUT....the authors did, and I abide by their wishes.

As a programmer I can imagine how much time and effort the Atari800
development team has put into this project. I appreciate the results and
enjoy playing the games again and doing stuff on the Atari I was never able
to do because of a lack of hardware. I don't want to sound like an
unappreciative user demanding that this be fixed. I didn't even think it
was a bug... just something I was doing wrong or something that wasn't
supposed to work. I don't expect the team to make this one change and
release the next version. From Nathan's post I got the impression that this
is something that could be added with what ever other stuff was on deck for
the next release. Nathan also mentioned that he fixed this with his own
copy and this got me to thinking that if he told me what he did I could do
it as well. Of course I can't even uncompress the source on my Win2k box so
this is not a likely avenue.

I'm a patient guy. I can wait....

Jeffrey

Dear Atarians,

I appreciate Bravo Sierra Computers very much. Over the past few years, I have bought dozens of items from Ben and have never had any difficulty. His prices are reasonable, the quality is excellent (he actually tests everything he sells), and delivery is prompt. Ben cares about the Atari community more than anyone I have ever met, and is totally committed to his customers. If you need anything relating to Atari computers, I am sure Ben Smith will either have it in stock or will find someone who does.

Sincerely, An Atarian Forever

I just dug out and fired up my 800xl to discover it's not working either. I get a black screen and red power light. Does not respond to any key on keyboard. Have no carts to test, but 1050 disk drive seems to power up ok. Doesn't seem like the 800xl trys to access it.

Could this be a PS problem as well or is the unit toast?

Thanks,

Jeffrey

They are still the closest thing to that, but no - 1st person means 'from within the cockpit', at least to me. Of course, in the meantime, I still play those two.

Damn, even the ZX Spectrum had one such game... Why wasn't there one for the A8?

> then _not_ releasing the code is even WORSE!

Well, I can only say that I did not read the license before I
contributed some things to Atari800 and even if I had read it
I would not have imagined what it can mean. I just thought it
a good idea to work together to make a good emulator with less
effort than if everybody programmed his own one.
Fighting in ones job sometimes is a necessity but people looking
for chances to fight in their spare time are not the kind I want
to work with.
And please don't anybody continue here about all the nice lawsuits
that have been fought or how only GPL saves the world from chaos.
I've had enough of that crazyness. Point. Full Stop. End. Bye.

Gerhard

# 1066. Cat-5 Walk (Was re: Netwalk)

From: bill@newbreedsoftware.com
Message-ID: <sA22a.65536$lk.2737210@typhoon.sonic.net>
Source record: 23379

Ok, so I've begun coding. Just barely, though. :^) I've come up with
a SIFE font (an inefficient one at that, but I don't care) that represents
the shapes needed on the screen.

I also found a photo of some CAT-5 cable and made it into a title screen.
The name of the game is officially "Cat-5 Walk" :^)

I'm writing it in TurboBASIC XL, since it's quicker to code in
(I'm rusty, and am using Atari800 under Linux to do the development).
All I'll really need is a bit of VBI code to make the screen 'flicker'
properly. (Right now I'm doing it very slowly using POKE 756,... :^)
But just to make sure the font looks right.)

Anwyay, you can see new screenshots here:

http://www.sonic.net/~nbs/cat5walk/

Enjoy! :^)

-bill!

From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <b2aeq8$j1n$2@mamenchi.zrz.TU-Berlin.DE>
Source record: 23380

Hi,

>> the lengendary turbo basic is now available on
>> cartridge from video 61.

> This rules! :^)

> BTW, I'm thinking of getting a MyDOS cart, too. What version is on
> there, though? (I prefer 4.53/4, specifically)

> Thanks! :^)

Does this have a licence from the copyright holder of TurboBasic? (Which, as
I would suppose, would be either Stephan Ossowski or Happy Computer)? (-;

So long,
Thomas

# 1068. Multi Zoom Master released under GPL

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-11 09:34:20 UTC
From: Carsten Strotmann <cas_news@strotmann.de>
Message-ID: <b2afql$19qa0t$1@ID-174234.news.dfncis.de>
Source record: 23381

Hello,

Multi Zoom Master ist released under GNU License under
http://www.strotmann.de/twiki/bin/view/APG/MultiZoomMaster

Multi Zoom Master is a Turbo Basic PGM for editing GR15 Pictures in Zoom
Mode, especially for high-detail pixel by pixel work.

I used this program to create pictures for some of my games.

Regards

Carsten Strotmann

Power suply seems to be ok! But the POKEY is very, very warm.
When I plug in the external cartridge. And run SELF TEST, keybord doesn't work (only function keys work) And when I choose audio-visual tests only first and second sound generator works fine, third, and fourth are muted!

POKEY chip seems to be broken. In my opinion

Thanks for help.

Keep On Atarin'!

/mcdenko

Hi Rene,

yes Tbasic is loaded into memory, if you boot the cartridge with a DOS
disk on the drive (dos 2.5 or mydos) you can use dos command from
turbo basic (like: DIR, LOAD"D:FILENAME.EXT" ETC...

I'd vote for a Shining Force game. Should be no problem as the graphics
isn't the most important and just get the levels and designs properly done.
SF3 on the Saturn is not that easy though, but the Genesis/Megadrive ones
are 2d and should pose not too much trouble. But how do one start something
like this ? I'd love to start it someday, but how to get all the level
designs and characters and weapons and and and and to be identical is hard.
Maybe one should have the source code ?

Actually I meant the Plus side of things, I have no doubt that the
Atari800 team will amend the code but the Plus side could be a fair
while for other reasons.

Yeah,
I know what you mean. It was mainly meant for the sources (e.g.
archiving all sources of the 64k version in one ZIP or ARC file, all
sources for the 128k version in a second and all sources for the 320k
version in a third), so there is no need to download 10-20 files... just
an idea or a suggestion, nothing else (and not a complaint!)...
greetings - Andreas.

Yep,
you are right! Especially the one-player version is extremely too hard
if not to say almost unbeatable/unplayable... -Andreas.

P.S.: But there is a two player version, just press select or option,
until "10" changes to "20", then you can start the two-player version...

Well,
artifacting also works on PAL machines - but different to NTSC machines.
read an article in PAge 6 / New Atari User on how to use artifacting on
PAL Ataris. Afaik, the bad thing with artifacting is, that there is not
only a difference between NTSC and PAL (NTSC artifacting will not work
on PAL and vice versa), there is also the problem with different tvs and
monitors. meaning one may have ten different results on ten
monitors/tvs... -Andreas.

Source record: 23393

Well,
there is a sort of CAS-emulator or multi-DOS converter, known as
"Sequential DOS" from Antic (or analog). It loads files sequentially and
can convert between different DOS versions as well, as from tape to disk
(it even emulates the tape, e.g. files are loaded from disk with CLOAD,
yes they are loaded from disk with CLOAD!)
-Andreas.

P.S.: As always, e-mail me if you are interested in this software...

Yeah,
a racing game like chequered flag from Atari Lynx (not the rubbish
Jaguar version!) would be great to see on an A8... But it is a sort of
realtime game (every driver holds his place, there are no random enemies
or computer drivers that suddenly appear in front of you like in Pitstop
1+2, Pole Position, etc.). it also provides many different tracks and up
to 6 players simultanously. Maybe someone can program a similar game for
the gamelink-2 (multilink) device, allowing at least up to 4 players
simultanously, different tracks, championship/tournement mode and
realtime gameplay... -Andreas.

Well,
we already discussed these ideas dozens of times. They are nice and good ideas. But where are the programmers willing to do them ?!? Any programmers (who have the motivation and time!) out there who still search for game ideas ?!? If there aren`t, we should not discuss these ideas over and over again... -Andreas.

In my last post, I stated you needed to know operating system calls to get anywhere in MAC/65. Another approach is to mix assembly and BASIC; this is how I started out. Once you are comfortable doing this, them jump into the assembly world all the way. I am posting a little source code for you to experiment with. I think mixed assembly and BASIC may actually be the best approach for someone who is just beginning to learn assembly, since basic can do all the printing and input from the keyboard, and you can reserve assembly language for only the real slow things such as sorting items. Consider the following section of code and how to use it in BASIC. This code moves memory from one location to another with the command x=usr(32768, SourceLocation, DestLocation, Bytes)

Assemble the program program listed below with MAC/65
(ASM,#-,#D:MEMMOVE.OBJ)
Boot up with basic in, go to DOS (DUP.SYS), and do a binary load of memmove.obj (I don't think MEM.SAV is necessary because of where I placed the code)
Go to basic and try a few things, such as

X=USR(32768, ADR(A$), ADR(B$), LEN(A$)) to set B$ equal to A$ (except for getting the two lengths the same)
try some arrays--
DIM A(100), B(100)
x=usr(32768, adr(A)+6*STARTA, ADR(B)+6*STARTB, 6*NUMELEMENTS) to copy some numbers from one array to another.

If you create another subroutine, it will have a usr call of
x=usr(32771,...)

Here is some sample source code for MEMMOVE.SRC; I didn't optimize this source code and I know many places where I could make it smaller; I wrote it in a manner to hopefully be understandable by a beginner.

```
10 RETURN.VALUE = (Someone help me, I forgot how to return a value
from a usr call)--For now, use $600; it is well out of danger of
hurting anything in BASIC
20 MM.SRC = 128 ; I can't remember a safe place in the zero page for
this, so I make a call to save and restore what locations I need to
use.
; Because of indirect addressing (lda (...),y), I must use a
location in the zero page.
30 MM.DEST = MM.SRC+2
40 MM.LEN = MM.DEST+2
45 *= (Help me, I forgot where the location is that tells basic the
end of RAM) Ignore this and the next line until you find what
location to use here
46 .word $7FFF ;
50 *= $8000 ; This is fairly high and out of the way of BASIC
60 JMP MEMMOVE ; Place all your entry points in a group here at
the start when doing a mixed-language project; this way they always
have the same entry point.
70 ; Place additional jumps here as your project
expands
80 MEMMOVE
90 PLA ; This tells how many arguments were passed by
the x=usr command. Even if you don't pass any arguments to your usr
function, at least one PLA is necessary
0100 CMP #3
0110 BEQ *+5
0120 JMP MM.WRONGNUMBER ; This is necessary of branching range; I
actually wanted "BNE MM.WRONGNUMBER" --I wish MAC/65 had an option of
doing this automatically if the range was too far.
0130 JSR SAVEZPAGE ; I don't have "MAPPING THE ATARI", so I don't
remember what is safe to use in the zero page. This saves the
locations I am using
0140 PLA ; Reads the high byte of the first argument
first, then the low byte

1690 .WORD RTS
1700 .WORD RTS
1710 ; I don't know what the address is that tells BASIC
where the end of RAM is, but you will want
1720 ; to go "*=..." for this address and then do a
".word $7fff" to protect this program.
```

Note that to call MemMove from another subroutine in assembly, a JSR won't work because of how BASIC calls subroutines, but the following, which is a little advanced, will work (assuming I didn't make any typos):

```
lda #>(ReturnLoc-1) ; This sets up the stack so when I call
MemMove, it knows how to return.
pha
lda #<(ReturnLoc-1)
pha
lda #<Size
pha
lda #>Size
pha
lda #<Dest
pha
lda #>Dest
pha
lda #<Src
pha
lda #>Src
pha
lda #3
pha
jmp MemMove ; I Don't call it with a JSR--the return location is
already on the stack with the command "LDA #>(ReturnLoc-1)
ReturnLoc
```

It could be a weak power brick, but is probably not... What it definitely is not would be the fuse since you have the red pilot lamp; a fuse is an all or nothing situation.

# 1086. Atari stereo-sound software...

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-11 17:55:28 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3E493910.F6760C7A@students.uni-mainz.de>
Source record: 23299

Hello folks,
here is a short(ened) list of Atari programs, that support stereo via 2
Pokeys / Gumbys (in one computer). The full list (which also contains
other stereo enhancements and thus other stereo software) can soon be
found in the A8FAQ by Michael Current. Anyway, here we go with the
programs that support stereo with 2 Pokeys:

- Stereo with two Pokeys: There already exist dozens of sounds and
demos,
that support this upgrade, most of these programs were made in Poland,
but a few sound-demos were also made in other countries. Anyway, the
following programs support stereo via two Pokey chips:

- Alf-Demo by the Unknown Base (Netherlands);
- Alpha-Demo by GMG (Slovakia);
- AMS-Stereo player by ??? (author unknown), USA;
(there are at least two AMS-stereo-players, that let you play
*.AMS sounds in true stereo or at least simulated stereo!);
- ARS-Mori 16k Intro by Tristesse (music shortened and ripped from
Drunk Chessboard by Infinity!), Poland of course;
- Ballada sound by DJ V / BK (Poland);
- Base 33 by AIDS (msx by Greg, Poland);
- Chaos Music Composer version x.x patched by ??? , Poland;
(=> the original version by Janusz Pelc / LK Avalon is only mono,
but there is a patch available, as well as various patched CMC
versions on the internet; thus *.CMC sounds can be generated in
stereo!);
- Cogito-Demo by AIDS (Poland)
- Do you see the light? sound-demo by Roemer of UNO (Germany);
- Draconus, patched version by ANG and/or Micro Discount (NL/UK)
(the original version by Zeppelin games is only mono!);
- Drunk Chessboard by Infinity (music by X-Ray!), Poland;
- Impossible but Real Demo by MacGyver (Poland);
- King of Aggregat by X-Ray / Slight (Poland);
- Megaplayer Versions 1.6 and 2.0 by MacGyver (Poland)
(=> and thus all *.CMC, *.MPT, *.TMC, etc. sounds played with
this sound-player tool can be heard in true or simulated stereo!);
- Multi-Pro-Tracker 2.4 (various versions) by Jaskier/Taquart?
(=> thus *.MPT sounds can be generated in stereo!), Poland;
- Nazebany by DJ V / BK (Poland);
- Overload sound by X-Ray / Slight (Poland);
- Stereo-Patch for Pokey Player by ??? (author unknown)
(=> thus all Pokey-Player / *.V sounds can be heard in stereo!);
- Stereo-Patch for Softsynth by Freddy Offenga (Netherlands)
(=> thus Softsynth will create stereo-sounds!);

- Stereo Patch for World of Wonders by Freddy Offenga (Netherlands)
(World of Wonders is a great Softsynth sound-demo!);
- Time sound by X-Ray / Slight (Poland);
- Theta-Music-Composer version 1.x by Greg (Poland)
(=> thus *.TMC sounds can be generated in stereo!);
- Vanity sound by Kuchara / Excellent (Poland) ;
- Zybex, patched version by ANG and/or Micro Discount (NL/UK)
(the original version by Zeppelin games is only mono!);
- thats all what I found so far... (A.M.)

Well, do you know any other programs that support stereo via 2 Pokeys
?!?
greetings, Andreas.

My mistake. I forgot to mention the Rogue verions I liked and played are for the PC. They were fairly simple if huge: ~60-80k file with CGA 80x24 built in color character mode, things like a T for troll, yellow *'s, that kind of stuff.

I'll see if I can find the Mastertronic version to compare.

It is pretty similar, if I remember correctly. Fun games, though my original
ST disk claims it's a copy :-(

And it is an awesome game, although I feel like I hit
a wall around level 11 (or was that 15)..

> I started working on another new game (like Puzzle-Bobble, I guess)
> recently, but haven't had time to work on it more.

Cool! I've been wanted to make a clone of Baku Baku, but I probably
won't have the time till I retire in 23 years!

# 1090. Re: Porting from C64 to the ATARI : Main differences of the systems ..

Hi,

> Same for vector-graphics games , the ATARI is a little bit faster,so
> games like "Driller" or "Total Eclipse" should be possible on ATARI
> without much change.The C64 does not use much colors here - only a few
> colors + dithered colors.

The Atari lacks the colour attributes the C64 has, i.e. each 8*8 pixel
character
can have a different foreground and background colour, or in 4 colour mode
the colours can be altered similarly. For the first type, you can get around
this
on single lines with DLIs (e.g. text adventures) or PMs and the second type
can be
done with 'static' screens (see
http://www.atariage.com/forums/viewtopic.php?t=18251)

On the 3D front, Carrier Command was on C64... could be OK.
Captain Blood - nice 3D fractal flight over planet
Starglider - better on the 16 bits
World Class Leaderboard - why didn't we get this? (stretching the 3D
catch-all a bit there ;)
Or the ultimate "Stunt Car Racer" (I loved this on the ST)

So many games, but like Andreas pointed out, who to do the work?
I don't mind helping out getting people going with disassembly help etc,
or overseeing projects I've got a little way with (except Elite) and
boards like AtariAge have forums where ideas on different ways
to implement an idea can be discussed.

One thing we all seem to overlook is copyright but from what I've seen
of Linux/Windows ports (or "tributes") to old games (e.g.
www.newkind.co.uk),
to the most part companies appear not to mind so long as you ask.
Getting hold of original source is pretty hard I guess, so if you are
prepared
to pick a game apart in order to put it back together on another machine -
all power to you (and me!)

Final point, why do it at all when there's plenty of good emulators out
there?
Like 'Son of man' said earlier, "it's a great hobby trying to push the Atari
8-bit to the max."

'Night all!

Mark

# 1091. Re: Need 1200XL

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-11 23:06:01 UTC
From: billko@comcast.net

Source record: 23302

Now this was a long time ago, so maybe I do have an imperfect recollection, but I could have sworn that this was a pretty well documented problem that everyone liked the 1200XL for the slick keyboard, but the 800XL was much more compatible with software. But like I said,this was all way back when I bought these computers NEW, so I cannot say that what I am saying is correct with absolute certainty.

I actually appreciated the lack of BASIC, as it was much easier to boot up. I hated pressing the start button (I think?) to disable the built in basic cartridge.

I didn't find much info at the web site, sooo...
1) What is the memory footprint of the cart version?
2) How much ram is left for programs -- same as disk version?
3) Is this a "regular" cart, or a load and pull like the Dos carts?
Thanks,
Larry White

Yes, from what I understand you will not find a superior character editor to Envision. Its author is a nice guy (I exchanged a few emails with him).

Its just like riding a bike, when you plug it in again. I have just got a 800XL modified, and I soooooooo enjoy Alternate reality again. Reliving my childhood. Got it in 1983, now I am a full time technician.

I don't care that much to bother him, but Richard can if he wants to. I brought this issue up on gnu.misc.discuss and one guy thinks the emulators are illegal (which I suppose would apply to ALL emulators that do not come with the official ROMS or with a free equivalent). Go figure. The irony now is that Derek is in the same boat since his last work was to port Atari800 to the MAC (look on his home page; he's no longer working on it). Interestingly, he mentions you need the ROMS but doesn't say how or where to get them. He doesn't mention XFormer or anything else Atari specific.

I'm going to drop the issue here, since I'm just going around in circles with Richard, but if this issue interests you check gnu.misc.discuss and see if there's been any more conversation on this subject. Its a subthread of "GNU is not FREE and that's GOOD".

I have no clue where it comes from, but I remembered it (I probably heard it on TV in some quizshow). And I also remembered that you speak german, that's why I didn't even try to translate it.

There is/was "Speed Run" by Red Rat software. IMO not a real good game,
but you didn't specify a certain quality level :-)

A very funny thing about this game was, that the game itself didn't
have any background music, but instead came with an audio cassette
that you should put into your tapedeck while playing the game!

I still have this game somewhere in my mess^H^H^H^Hcollection, but
haven't played it for some 10 years - it just isn't a great game IMO...

so long,

I tried hard to ask for the permission. Talked with some people @atari and
@hasbro but that was it. They promised to ask someone else in the
hierarchy but never replied back to me.

Just FYI.

I still play AR City and Dungeon from time to time. There STILL isn't anything quite like it. They never did do "Wlderness" because it was technically impossible back then. I wish they would try again. With today's tools, I bet they could do an excellent job.

I been doing some assembler stuff for a BASIC
game.
I load my first GR 7 screen.
Shift some bits to be able to use the internal char.
set to print to the GR 7 screen.
Right now my game is slow at the print to GR 7
parts. The section of BASIC has lots of IF THENs
and FOR NEXT loops. If I can get this over to
assembler I think it will make my speed ok.
Which is the main idea behind doing ml in BASIC
programs.
Best would be not to use BASIC at all. I've done
some ACTION, but never fairly complex program
using assembler. But BASIC is at home to me, you
can do ANYTHING with Atari BASIC you can do
with assembler, if you have the room.

Source record: 23324

The legal niceties.
We've got the ROMs, they're available, use them.
We've got A800Win (plus?). Use it.
We don't have Aaron Wheeler's site any more.:(
We don't have Atari++ any more, it was too short
lived for me to snag a copy.
I think it probably was substantial improvement over
A800. I enjoy A800, but it crashes fairly often.
It does more than XLIT, but XLIT is much faster
and does most stuff quite well. XLIT won't do
ABC compiler 1.02, A800 will.
I understand Petr wanting credit where Thomas
used A800 basics, but the end user really doesn't
care what license is used, I just want to use the
proggys.
I'm writing a game that comes from HP 48 calculator
game. I copied the graphics bit for bit on graph paper.
I know I don't have an original idea and am trying
to duplicate the original, with maybe some color added
where the calc is grey scale only. It'd be fine to tell
the HP guy what I'm doing and get his ok, but I can't
contact him, and it really doesn't matter.
John Harris got sued for 'Jawbreaker', not because he
used any Atari code, but because the game resembled
PacMan too closely. There was one company, (coleco?)
that made a game machine with a Pacman clone, I
bought that machine for my son, it went out of business
and never pulished any more games, because Atari
sued them for the PacMan clone.

Thanks for all the replies on this. It seems that the majority choice is
the MAC/65 assembler. Now, does anyone know where I can get ahold of this,
in any format? I've also been watching the "How to learn Mac65" thread,
and I haven't seen any pointer on where it can be obtained. Cartridge or
disk image (if it happens to be public domain), either one would be great.

## 1114. New software: AtariSIO for Linux

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-12 20:54:25 UTC
From: Matthias Reichl <usenet-20030212@hias.horus.com>
Message-ID: <slrnb4lctr.2mp.usenet-20030212@camel.hias.horus.com>
Source record: 23326

I've just uploaded AtariSIO V0.10 alpha to my homepage:

http://www.horus.com/~hias/atari/

The package contains the following stuff:

* a Linux kernel driver to handle the low-level SIO stuff
* atariserver, an Atari disk emulator like SIO2PC or APE
* atarixfer, a small utility to transfer ATR files to/from
a 1050 (or other Atari disk drive) connected by a 1050-2-PC
or a ProSystem cable

Since the software is still alpha, it's quite likely that it
contains several bugs. Please contact me by email if you
have any troubles.

so long,

Hias

PS: share and enjoy, it's GPL'ed!

Sweet! If you need any future volunteers for beta testing, give me a
yell. I'm currently using APE with a old, dedicated DOS machine (because
of some issues running under XP), but I'd love to be able to use my Linux
box instead.

But developers DO care what license is used, and if it's being
violated. Without developers who aren't getting pissed off and
ripped off, end users have no software!!!

c64 vs CPC vs Speccy vs Atari vs Whatever(tm)

My answer to your pathetic flaming arguments and to other peoples pathetic arguments about which computer is better. Blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah, or c64 blah. Blah blah blah, and blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah? Blah blah blah blah blah blah blah blah blah blah blah blah blah blah, because blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah, cpc! Blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah! Blah blah blah blah blah blah totally silly. Blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah stupid, stupid, stupid! Blah blah blah blah blah blah blah blah blah blah blah blah. Blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah, and not only that, but blah blah blah blah blah blah blah blah blah blah blah blah blah blah. Blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah. Blah blah blah blah blah blah blah blah blah blah blah blah blah blah!! Blah blah blah, and blah blah blah blah blah speccy blah blah blah blah blah blah! Blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah!!! Blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah. Blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah. Blah blah blah, and blah blah: "blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah". Blah blah blah blah blah blah blah blah blah blah blah blah blah atari!! Blah blah blah blah blah blah blah, blah, blah, blah, blah! Blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah!!! Therefore blah blah blah blah, or blah blah blah blah blah blah blah blah blah blah, is not blah blah blah, but blah blah blah blah. IMAO, blah blah blah blah blah blah blah, or blah blah blah blah blah blah blah blah blah blah blah blah totally worthless! Blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah blah, and go to hell with your stupid flamewars! Visit Forever 4 - multiplattform 8 bit party this year in March 14.-16.2003 in Trencin/SK.

Message-ID: <oVG2a.65998$lk.2775669@typhoon.sonic.net>
Source record: 23336

WHEW! Ok... I'm REALLY rusty, I guess. :^) It took me an hour or two
to hand code machine language for a DLI that'll do the screen flipping
for SIFE mode. (I gave up trying to use a VBI; it was just getting too
frustrating. Besides that, De Re had an excellent example DLI that I was
able to base mine on.)

So... right now, the game loads, displays the title screen, loads the SIFE
font, and then displays a test screen with the 'shimmering' image on it.

(It did this before I went through the blood, sweat and tears of
remembering DLIs and hand-coding ML... it just did it very SLOWLY.
Now it's flickering at 60fps; just what I wanted!)

Yes, an Atari is better than a Spectrum, Commodore 64 beats the Atari. This
is common knowledge.

Well, some do, others don't. Most people I think care more for
common sense and therefore I still hope that Petr and Thomas can
find some sort of agreement and I'll be happy if they do, regardless
whether it fits to the letters of the GPL or not.

In Austria there's a saying "Wir werden schon keinen Richter brauchen"
which basically means that laws are only needed when people are not
able to reach an agreement and it's always better to reach an agreement
without needing a judge because only then both sides are satisfied.

I've updated 6 of my 8 Catalogs, all 8 Bit and ST. Adding many new items!
Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari
Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari
Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods!
So not only do I sell NEW Atari Goods at a competitive price, I also sell
used Atari Goods you may not be able to find anymore at Swap Meets, Thrift
Stores or even Auctions Sites! And I sell for less! And unlike those who
will remain anonymous! I test Goods before I sell them. I can afford to
sell for less because I keep overhead down, avoid making promises I cant
keep and avoid offering services I cant follow up on! So not only can I
sell you some Great New stuff! But I can sell you hard to find 2nd Hand
Goods, partly because I'm the guy most people come to when they want to
give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion!
Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org
Or goto my Domain at http://BenSells.Atari.org or Call Ben@(503)256-9974!

My experiance of other systems of the era is limited to the Spectrum

Hmm, I remeber a version of Sim City on the Spectrum! I think populas was
out for it as well. Also a cracking little real time stratergy game called
stonkers, Limited forces, no building, just one map, but it was a cracker.
Lords of Midnight would be nice as well. Not to mention the Ultima games.

Elite would have been brilliant. I mean if it can handle Mercenary, it
should handle Elite.

A first person shooter? I'm proberbly being over optimistic with that idea.
Could the hardware handle it and produce something enjoyable.

and obviously the major arcade machine conversions that didn't make it to
the atari.

But i'm rambling :)

i guess nobody in a8 population cares in the least about Lisp.

save me... interlisp/65 came out finally in version 2.5 from analog or antic i believe. i have 2.1 and would be interested in the newer versions. a nice a8 person offered me 2.2 before. does anybody know anything about interlisp/65 or am i gonna have to use that hunk of apple 2e ? i dread that thought.

Hello,

I care :)

I have to look into my collection, but this will be on monday (I'm on the
road for the weekend).

I'll write you what I have found on my InterLISP/65 versions.

On my LISP-Porting-from-Oric-Project: I currently learning LISP and LISP
inner workings (e.g. reading the Books ANSI-Common-LISP and Lisp in small
pieces). I don't want to publish anything in public until it is usable to
some extend, if you like to join the team contact me on private mail.

Regards

Carsten

# 1131. Looking for Valpar FORTH

Forgive me for asking, but what is SIFE mode?

I'm just now getting back into Atari 8-bit programming and assembly language. While I know I'll never turn out anything close to a Numen or Drunk Chessboard demo, I am hoping to have my 1st "real" assembly language DLI that will split players down the screen (changing their position and colors). I just want to see how many independently moving sprites I can get on the screen at one time without interlacing.

I have made a couple of jokes and little comments about C64s and the like but I really do believe that blatant flaming and aggression towards users of other formats is stupid as we can learn from each other.

An example of this is that the C64 has been upgraded to a far higher level than the beloved
Spectrum (Hallelujah!) but if we used similar procedures (obviously adapted) we could do the same and what about the MSX?

Have you guys seen what the boys in Japan have done with those - WOW!?!

If some of the upgraders over here were to work on their machines in a similar fashion then we could see the 8-bit machines gaining more respect from the wider computing world.

You wouldn't need to - stick an eZ80 in the CPU slot of a CommodoreOne,
reprogram the reprogrammable hardware, et voila.

You missed the Jupiter Ace newsgroup. Surely for one of the most unique machines the 8bit world has ever seen & it's totally forgotten! :-(( He he he.

But your correct, the older the computer the more love it has. A computer is like a car, all those people do, is do their old cars up. No-one gives a toss about a new car (well there are a few out there, that do things). Anyway my point is most people use their car as a tool, rather than a thing for showning off & the majority of old cars that I see are done up. Anyway no-one cares about new computers, there is not as much love put into a new computer, rather than than an old one.

But who really cares which computer is better as long as it does what we want it to do? If it's just sitting around doing nothing, then it's useless? So to all my mates over in C64 land, you really do have some fine hardware over there for that machine & as long as you can use it, well then fine. I don't need my machine running with extra speed! :-))

Ross.

Mopar Man <nospam@nowhere.com> wrote:
>
> Forgive me for asking, but what is SIFE mode?
>
<snip>

Sorry; I actually call it "Super IRG." SIFE is technically the
font editor that I created that lets one make Super IRG fonts.
(SIFE = Super IRG Font Editor; See: http://www.newbreedsoftware.com/sife/ )

Super IRG mode is a software-driven 'flickery' mode
(like APAC, ColorView, HIP and RIP).

It uses an IRG mode screen (aka "GRAPHICS 12" in Atari BASIC on XLs and XEs),
which is of course 40 characters wide by 24 characters tall,
each character being 4 pixels wide by 8 pixels tall. (Therefore, the
screen resolution is 160x192; just like "GRAPHICS 15" mode in Atari BASIC.)

In IRG mode, you get 5 colors. Four colors can be used in a character
at a time. A 'normal' character can use colors 1, 2, 3 and the background.
An 'inverse' chracter (high bit set; CHR$(128) and up) has one of the colors
changed. (It's still the same shape; it's not inverse-shaped, as it would
be in GRAPHICS 0 mode.) It gets colors 1, 2, 4 and the background.

In Super IRG mode, you get to 'blend' certain colors by flickering between
two character sets (fonts).

The simplest example is if I have two colors; black and white.

In one character set, I'd draw the letter "A" like this:

```
....
..#.
.#.#
.#.#
.###
.#.#
.#.#
....
```

It would look like this on the screen:

```
##
## ##
## ##
########
## ##
```

## ##

(Remember, the pixels are approx. twice as wide as they are tall in
GRAPHICS 12 and GRAPHICS 15 modes.)

In the other character set, it'd be _slightly_ different:

....
.###
.#.#
.#.#
.###
.#.#
.#.#
....

You can imagine how it would look on the screen.

Now, flicker between those two character sets
(simply a matter of changing CHBASE during every Vertical Blank Interrupt (VBI))
and the spots where it's white half the time, and black the other half,
ends up looking pretty much like grey, to our slower-than-60fps eyeballs :^)

++##++
## ##
## ##
#######
## ##
## ##

Note that there are no Display List Interrupts (DLIs) involved here,
no color palette changing, and only one chunk of screen memory you're
drawing in. Just a very short and simple VBI.

_ONLY_ CHBASE changes. You get 160x192x14 colors with only
768 bytes of screen data (40x24 characters) and 2K of font data
(1024 bytes for each font; 8 bytes per character times 128 characters).

You can write a BASIC routine to load the font data and set up the VBI,
and then you're normal BASIC interface will be in that mode.
Edit the data on the screen with the E: (Editor) device like you would
normally. :^)

So far, there's one game that uses this mode. My old game "Gem Drop."
It's written in Action!, and comes with the source. It requires a 48K
Atari 8-bit (800, 800XL, 1200XL, 65XE, 130XE or upgraded 400 or 600XL):

http://www.newbreedsoftware.com/gemdrop/

And, of course, there's the "SIFE" editor. It's neat because it lets
you edit 2x2 characters at once (8 by 16 pixels), which is a nice size for
tile shapes (like the gems in Gem Drop) in 40x24 modes. Even nicer, it
does dithering for you.

In APAC and ColorView modes, for example, you can't 'dither' the colors
horizontally. The blending ONLY occurs when scanlines change mode or color.

e.g., in ColorView mode, you see:

Red line
Blue line
Green line
Red line
Blue line
...

And those colors kind of 'shimmer up the screen.'

Since there's no palette or screen mode changes in Super IRG mode,
you can dither pixels horizontally.

In other words, to get a grey block shaped like this:

++++++++
++++++++
++++++++
++++++++
++++++++
++++++++
++++++++
++++++++

you would NOT want to do this:

Frame 1: Frame 2:

.... ####
.... ####
.... ####
.... ####
.... ####
.... ####
.... ####
.... ####

It would flicker MUCH too obviously. The SIFE editor realizes this, and
when it saves the font data to disk (as the two 1024-byte-long fonts),
ends up dithering it like so it does it like this:

Frame 1: Frame 2:
#.#. .#.#
.#.# #.#.
#.#. .#.#
.#.# #.#.
#.#. .#.#
.#.# #.#.
#.#. .#.#
.#.# #.#.

(two little checkerboards). The theoretical result is the same:
a solid grey box. It just looks much MORE like a solid grey box
(and not a blinking white box) in real life. :^)

Whew! Does that answer your question!? :^) :^)

> never ported.
<snip>

Heh.. I'm (kind of) working on a _Puzzle_ Bobble (aka Bust-a-Move) game. ;^)

Here's a test screenshot of the graphics (Super IRG mode):

http://www.sonic.net/~nbs/fbatari/emu.gif

Not quite the same. :^) (Bubble Bobble was a platformy-game, no?)

# 1144. Galaga for the Atari 8-bit - coders wanted!

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-14 08:00:01 UTC
From: bill@newbreedsoftware.com
Message-ID: <5m13a.66201$lk.2791760@typhoon.sonic.net>
Source record: 23157

So I popped Galaga in my Nintendo NES today and played for a little bit,
and decided that a reasonable clone (perhaps not identical, but close
enough to be entertainign :^) ) would be done for the Atari 8-bit.

I started playing around with bug shapes that could be displayed with
Super IRG mode (40 x 24 characters, 4x8 pixels per character, 14 colors total)
and I think, even though the bugs would move a minimum of 4 pixels left and
right, and 8 pixels up and down, that it could be done!

Here's a little GIF animation of what it could look like:

http://www.newbreedsoftware.com/atari-galaga/

I don't think I'm the guy to do it, though. :^) I'm happy to help with
art and design, though!

Any takers!?

## 1150. SIMMS and refresh problem

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-14 13:36:06 UTC
From: Marius Diepenhorst <grover25@zonnet.nl>
Message-ID: <b2irbh$pld$1@reader11.wxs.nl>
Source record: 23163

Hi!

In my 130xe I have build (thanks to TXG!) an extra 256kb; now it's 320kb.
This expansion is very simple: you'll only need an 74HCT158 to do this.

But now the problem. I have build this expansion in a few XE's. When I use
DRAM slower than 100ns everything is ok. But on the xe's I used 80ns, 70ns,
60ns the refresh is having problems. How to fix this?

I have heard there are simms (1mb or more) that do this refresh for the
whole 1mb by itself?

Who can help?
thanks,
Marius

Take a 74LS08 and AND the CASBANK signal with the REF signal. The result is
your new CASBANK signal.

BTW does the screen flicker with this upgrade when you access a bank of
extended RAM?

Hey Mathy,

Can you be some more specific. My knowledge about AND's etc. is ZERO :-) ...
so I have to piggy back a 74LS08 and then? Which pins should I connect to
what?

The CAS from the rams or the CAS from the mother board? What is the REF
signal? Is that RAS?

Greetz.
Marius

p.s. the screen doesn't really flickers. The screen does flicker on another
XE, but that one is functionating OK

I bought Archon on cartridge back in 1988 or 1989. It didn't work on the
Atari 400 I had at the time, and ISTR that the box said it required an
XL-series or later system. I don't know about the other titles you
mention, though.

Hello,

I would probably try B&C Computers. Then seem to have everything
for the 8-bit. Best Electronics is another good place.

http://www.myatari.com/

http://www.best-electronics-ca.com/

I have a copy of that, plus the image disk version in DI format.
Comes in handy from time to time.

## 1162. ATR files and SIO cable

Newsgroup: comp.sys.atari.8bit

Using a SIO cable, and copying ATR (emulator) files to a 5.25" disk - will the files run on the Atari? If not, is there some "conversion" process so they will run?

Thanks for any information,
Mike

Unless you are talking about the Mega games thingies, which isn't possible
to fit on a 5 1/4" disk, yes. All the ATR's I tried works fine on my REAL
Atari (Emus suck, cause they won't run my demos properly)

If it's a standard size ATR and your drive supports it (SD/ED/DD) then all
except the Mega Images will work (they are pretty big, 1Mb or so I think)

Take Atarian care

# 1164. Re: turbo basic is now on cartridge

why isn't turbo basic not compatible for the 400/800??

As far as I now, turbo basic was originally designed for the 400/800
series....

```
TB uses the same RAM ($C000 or something)
that SpartaDOS uses and the 800/400 don't have
as RAM.
Tom Hunt made a TB version that runs on Sparta/800,
if I recall.
That's why you can't use the original TB with Sparta
or on an 800.
```

Hello All,

I've just started new eBay auctions for SpartaDOS 3.2d and 1.1HS. I have started a new auction for the Advanced Programming Techniques book at half the original start price. I also have some other Atari bits for auction too.

The link is below (this will split on to two lines, so please copy both lines into your browser):

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=deangarraghty

Just one thing to watch for, ATR files can include things like bad sectors that
cannot be copied directly onto a normal disk using a normal drive.You might
find that some uncracked game ATRs don't work.

Ok, no offers to buy the whole lot and I really dont want to move this stuff so FREE to anyone who will take all of it and can come pick it up by Sunday, February 23rd. I am in downtown Chicago (Lincoln Park..about 1 mile south of Wrigley Field). Offer expires Wednesday, February 19th which is the day I need to pack it for moving. If I move it, I may have time to mess with it and probably won't want to get rid of it then.

## 1175. Ethernet for 8bit?

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-16 08:51:34 UTC
From: James King <utah_lanman@yahooo.com>
Message-ID: <b2njem$lul$1@terabinaries.xmission.com>
Source record: 23188

Any progress to date on an Ethernet interface for the 8bit?

If not, what options exist to make it more network capable?

For now, my 8bit can either dialup or via RS232, access a Unix box to
obtain a telnet session (which is how I'm typing this now).

Any information appreciated!

## 1176. Weird Stuff purchase

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-16 08:53:58 UTC
From: James King <utah_lanman@yahooo.com>
Message-ID: <b2njj6$lul$2@terabinaries.xmission.com>
Source record: 23189

Just went into San Jose / Sunnyvale today and visited my favorite store, Weird Stuff. Came across a nice double SYDOS 44/2 (two mounted Syquest 44mb SCSI removable drives). Paid the $20.00 for it and crossed my fingers they'd work.

Happy to report that both Syquest drives fired right up, purred like kittens and are now driving several 44mb removable carts on my trusty 130xe.

Saw an old 810 disk drive down there too, but really didnt have a need for it.

Also, while I was in the area, drove by the old location for Atari HQ on Borregas Ave.. Looks like Veritas may have moved in, then vacated the building.

I don't think so. I'm not considering me very good in programming, and I'm not more interested in LISP than in other languages like FORTH or C or ACTION!.

My interest are progrmming languages, and I try to learn about the languages and the implementation.

I work on LISP in my spare time, and because I haven't worked with LISP before, I currently learning the LISP language as well as the implementation details.

> than i am. if their is ANYTHING that i CAN do to help this endeavor i

If you send me I private mail, I will send you the source as of today. It's assembler code for the ATASM Crossassembler, but it can easily be converted to an other assmebler syntax.

Please be patient because I cannot be online every day, so it can take some days until I respond.

Best regards

Carsten

# 1187. Rev "A" format and Happy Drives

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-16 15:18:10 UTC
From: llppwhite@aol.comnsp
Message-ID: <20030216101810.15573.00000297@mb-fv.aol.com>
Source record: 23200

Atari used at least 2 sector fomat patterns in the 810. The so-called Rev A was the first and quite slow format, which was replaced by the Rev B format about 1982. (I believe the change was coincident with the addition of the data separator board. "Grass Valley?") It reads about 20% faster than the Rev A on a stock 810. The Rev C format was never released, and it was supposedly another 10-15% faster than the Rev B.

But I've found that Happy Drives in Warp mode have trouble with the Rev. A format. It will not read these disks properly at high speed. Instead, it *sounds like* they are standard skew disks being read by a US Doubler in high speed mode. These disks will also frequently report bogus sector counts in the directory -- e.g. DOS SYS 23140. (A really ridiculous sector count number). If you put the disk in a regular drive or shift the Happy into slow mode, then they read correct sector counts.

This is *not* a hardware glitch on a particular Happy drive. As best I can tell it is a compatability issue. Does anyone have any info as to what the root cause might be? It is not really a significant problem, but a curiousity.

Larry

Source record: 23201

I know that. That is that TB32Q software. But that is not the answer on my question.

I'm pretty sure; turbobasic was originally written for an ATARI 400 by Frank Ostrowski. Ok the common version of Turbo Basic, is for XL/XE computers ... very nice ofcourse. But I'm still wondering, why a product that was developped for atari 400/800 now available is on cart and NOT compatible on those computers.

If turbobasic is stored on the normal locations, it might work on both 800 and xl/xe series.

It's www.weirdstuff.com.

But don't expect to find much Atari stuff there. Once in a while something like a disk drive shows up or maybe an ST. But if they ever came across large pallets of some good stuff, Brad Koda of Best Electronics will usually get his hands on it first.

Yep, I think its weirdstuff.com.. They have a ton of items listed for sale on their site. I just wanted to drive the hour into Sunnyvale, as it had been a while since I was there last.

Next week, I may drive down to BEST and make some local purchases [grin]

There is an upgrade kit for the XF551 that allows you to remove the 5.25
drive and replace with 1.44mb 3.5inch drive(s). I have one here that hasnt
seen much use lately. I know BEST sells the actual kit (sans XF551).

This is funny!! I remember the computer flame wars of the 80's on BBSes!
Not only has my 80's computer made it to the 21st century, but the
STUPID computer debates as well. <stupid, stupid, stupid> Uh guys,
we're not 14 anymore. (Well, maybe one or two of us) <smirk!>

My first love will always be my 64, even though I am a collector and
computer historian of many different 8 bit machines. They all bring
us back to a time when perhaps computing was a hobby, and the automation
that we have today was a promise of the future. This is why I enjoy
my 20+ year old computers. Who cares if someone else is hooked on
CPC, or Atari, or whatever.. For some of us, our first computers were
given to us as gifts, and the bond we have for one machine or another
was good times invested in our machines.

I.M.H.O.

Jeff

And what do you exactly mean by this post?

As far as stealth advertising is concerned, it's just the same as with the poll Micro-mart is running, but I at least don't tell people argue about stupid things and visit my site more. I tell them don't argue and join people who like to meet each other even when their 8-bit machines are so (??) different.

I wrote it because I don't like "one hundred plus one reply" crossposts which pop up on the news from time to time, they are so blind and full of misunderstanding. Everyone is typing some blah blah blah about whatever system they like and noone really cares about other system because they will never see it running in reality. Why is it good for? It would be a little better if those flamers at least runned emulators of the machines and check the possibilities for themselves. Mathew Westscott's crossplattform mini-game compo was good example of such activity.

Unfortunatelly ignorant people love to stay ignorant and that will stay until the end of ages it seems. If one is wise enough he knows that it's best to stay away from such discussions. Can we agree upon the fact that "one can't win a flamewar"? And if anyone eventualy wins.. he will still stay as wise and lonely as before... ;-)

I think another such activity would be a contest of sorts where people try
to port "best of" demos from some other platform to their own. :)

Hello CreaMD

I thought I'd better drop a personal line before this gets out of hand. :-)

First, the Object Connections/Marc Walters posts are both from me. I have several different accounts and one had my company's settings still installed. Sorry about any confusion.

Second, I do know who you are and what you do, I have been visiting the www.c64.sk site ever since it began.

I am NOT a rabid C64-only freak. I also own and enjoy using a Sinclair spectrum, Apple 2 and GS, PC, MAC, etc.

I understood perfectly and agreed with the purpose and spirit of your original post. My comment was entirely facetious and intended to be seen as such - ie an idiom of the typical C64 flamer. I apologise for not more clearly stating the post's purpose. My sense of humour is a bit strange.

I really cannot believe that anyone can take 8-bit vs 8bit flamewars seriously (I certainly don't) and that is the angle I come from in any flamewar -like thread. Check out my posts in comp.sys.apple2, c.s.sinclair, etc for confirmation.

I hope that clears this matter up.

Regards

Marc Walters

I think it's because it's "TurboBASIC XL" that's on cartridge, not the
400/800 version, simply called "TurboBASIC."

Sound right, guys?

I think the full name is "Turbo Basic XL", we just call it Turbo
Basic. There was 48K version called Frost BASIC for the 800, IIRC.

I now live in the Watsonville/Santa Cruz area.. I'm about 40minutes out of San Jose, 60 minutes out of SF area.

I've been through Davis so many times, can't even count them.. I have an older brother in Travis AFB, and a sister-in-law in Roseville (near Sacramento), and since I'm still travelling back and forth to Utah, I take I80 fairly often.

We'll need to discuss meeting offline. I'll shoot you an email.

> Do you ever go to ABACUS meetings?
> (It seems the next one will be March 1st)

Never went to a meeting.. But I probably would if I knew other 8bitters would be there. Your last comm. seemed to indicate that it was mostly ST'ers, and I never really cared for the ST series.

From: James King <utah_lanman@yahooo.com>
Message-ID: <b2ppdk$n4b$1@terabinaries.xmission.com>
Source record: 23220

Just this evening, had an odd thing start with my beloved 576k XE..

First, a bit of background: The XE is 576k upgraded, has the three OS ROM by CSS ( CSS+, MUX, standard), and all other imaginable upgrades including SuperVideo, SuperAudio, etc. The XE is always connected to my BlackBox, which is now connected to a dual set of SyQuest 44mb removable SCSI drives.

Accidently hit the tower of cards (RTime8, SDX, Express) and knocked them all out while the XE was powered on.

Immediately powered off XE, but upon power on, noticed that the SDX parms didnt appear to be taking (Ramdisk, command prompt, etc) and the machine has issues with performing a stable boot.

However, if I toggle over to the Mux ROM, all things are fine. Is it possible for jus a portion of the ROM to be flakey? I would think no.. but that's exactly how its acting.

Maybe I need to take it apart and ensure all solder connections and socketed chips are properly connected/seated..

Thoughts?

I'm not so sure. I think it is the 5.25" 1.2 meg floppy that can plug into an ATR. Even then, if my info is correct, you have to format it as an 8" DDDS drive.

I had a 1.2 meg drive I picked up for that purpose. Unfortunely my S.O. decided to move it outside last fall during a rainstorm. I've lost quite a bit of computer hardware to S.O.'s over the years. I can't understand why potpouri <which is a jar of dead leaves> counts as a treasured memory while my new never been used electronic gear or classic gear is stuff in a leaky basement, outside, or placed directly into the trash. Current S.O. threw away a black powder pistol I was rebluing!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> I hope that clears this matter up.

Thanx for explanation Marc. I'm sorry I didn't realise that sooner. It's mostly because I'm quite unfamiliar with all this philosphy behind news, I'm checking c.s.c. and c.s.s quite randomly and that's why I've got impression that people tend to spend too much time over those flaming debates. I've got involved to some of them unwillingly (like when some italian dude (he knows who he is was arguing with some german dude and hungarian dude about some tool). I felt a abused, especially when I got few personal e-mails from one of them. I've learned that few (far too many? ;-) people spend too much time producing content of low value here in a sort of twisted intellectual competition, instead of spending time in productive debate over various topics.

While I'm at it. I quite don't get what is binaries about. The way they are organised seems to be really contraproductive to me (I thought when there is so much software produced for C64 (as you can see at c64.sk) c.s.b. will be full of software too, but I was wrong. When I read the FAQ I cam to conclusion that problem is in 1. bureaucracy 2. bad presentation of sumbitted material. 3. long time unupdated web presence of c.s.b. (the system didn't work at that time and maybe it doesn't work even now. ;-) Now C.K. feel free to flame me, coz I'm so blind and don't get it... And btw. how about if you put news about VI at c64.sk would that be painful for you? ;-)))

In conclusion. News are very seductive.. on first look they seem like a really good place to learn something, to do something, but after few tries you will find yourself spending more time answering on posts of various degree of importance than actually working on something useful.

:-)

No No No No No!!!
How did this get in here?
Crikey! I'm having a bad Internet day today:
1) Replying to my own post
AND
2) The post was one meant as a personal emailed message.

I'm also beginning to have my doubts about the validity of Microsoft
Internet Express as a news/email client. Er, could everyone reading the
previously posted message please ignore/cover your eyes/whatever until the
cancel propagates? :-)

And don't forget - Visit Forever 4 - multiplattform 8 bit
party this year in March 14.-16.2003 in Trencin/SK.

Absolution?

Marc

Not eveyone over here is like that, that's a poor assumption.
However, I work in retail and alot of people were buying rolls of plastic and duct tape preparing for a chemial something or other. There are alot of stupid people over here, I'll grant you that.

I also killfilled the anonymous whoever and I'd classify this person as bored with too much free time, not a terrorist. ;-)

Would someone be so kind as to download and test the following program
on a real 8-bit?

http://cth.dtdns.net/atos/test.arc

It is a test of proportional fonts. I need to know the following-

1) Is it readable on your system?
2) Is artifacting a problem effecting readability?

If anyone tests this they can email me at the address at the bottom of
the following web page-

http://cth.dtdns.net/atos/

Thanks,
Tom

Ohhhh god no. A surefire way to make a really crap Spectrum demo (and yes, I'm sure the same thing goes for any other 8-bitter) is to blindly port demo effects from some other platform with no regard for whether it looks good or takes full advantage of the Speccy's abilities. Usually, the end result is some hideously complicated textured polygon bonanza running at ultra-low resolution and the speed of a dead sloth (and invariably backed by a high-speed techno soundtrack, just to emphasise how slow it is). Far better to do something original for a change...

Normally, you can pull a cart while you're powered up and it will not hurt.
Most electronic things only get broken from power-on disconnect when there
are two or more voltages on the chips.

Part of the data in a ROM can go south - happens all the time on EPROMs.

Me neither. Technically, I have one now. (Someone found it in one of
the officer where my group moved, and they decided I'd want it... I have no
use for it; there's no monitor, and they're expensive.)

Perhaps us 8-bitters can infiltrate a few of the next ABACUS meetings. :^)

There's definitely some interesting stuff to show off (VECTOR demo (NUMEN),
the latest Atari800 emulator, JDPEG, etc.)

Does anyone remember a basic program listing in one of the magazines in the "early 80's" (probably Antic or Analog - maybe Compute?) that was a text based game similar in concept to SimCity. You were responsible for distributing resources, planting crops, etc so that the "population" could prosper and multiply.
I believe the name of the program started with S.

I know this qualifies as a "little known fact, less cared about" But I would be grateful to anyone who might be able to help.

THANKS
Mike Lange

> original for a change...

Absolutely. It also doesn't make much sense to do, as an effect which is rather impressive on one piece of hardware is trivial on another. For example, the Shock megademo on the Speccy has that awesome full screen multicolour bit (part 2 IIRC) which looks terribly good for a Speccy. The same effect can be reproduced trivially on the CPC from within BASIC (set the CRTC to a full screen display, load a static bitmap and cycle the palette whilst playing some AY music).

Source record: 23269

Hi!

I'm using a PAL 800XL with a SuperVideo mod hooked up to the
s-video input of my 28" Panasonic wide screen TV (a TX-W28D3F,
nothing high-end, but quite decent though).

On Mon, 17 Feb 2003 18:06:34 GMT, Tom Hunt wrote:
> It is a test of proportional fonts. I need to know the following-
>
> 1) Is it readable on your system?

Yes, it is readable, but a lot harder than the standard Atari font.
I used the standard text "The quick brown fox jumps over the lazy dog",
which saves approx. 30% of space with your font (compared to the
Atari font).

IMO several characters don't fit into the font. Eg. 'v' is far too
wide and should be a lot (some 30%) smaller. Also 'l' looks quite
strange. Either add a horizontal bar at the bottom (like in the
Times font), or remove the horizontal bar at the top (like in
Helvetica / Arial).

Maybe you should try creating a font similar to Helvetica/Arial,
this could somewhat improve readability and also save some
additional space.

> 2) Is artifacting a problem effecting readability?

No. But this could be due to the s-video connection and my
PAL machine. I haven't tried composite or RF connections.

so long,

Hias

> Can you be some more specific. My knowledge about AND's etc. is ZERO :-) ...
> so I have to piggy back a 74LS08 and then? Which pins should I connect to
> what?

Piggy-back the LS08 on top of another 14-pin 74LS type chip, but only
connect pin 7 (ground) and pin 14 (+5V).

Next, cut the CAS signal line coming from your Atari (or memory
expansion logic) to the expansion RAM chips. Connect the CAS output
signal from your Atari to pin 1 of the LS08, and connect pin 3 of
the LS08 to the CAS line going to your RAM expansion chips.

Connect pin 8 of Antic (refresh output) to pin 2 of the LS08.

That's it - this implements a simple CAS-before-RAS refresh logic.

Most modern RAMs support this refresh type which is needed if your
RAMs are organized with more than 256 rows internally. Antic only
supports 128 (or 256?) rows for RAS-refresh. Usually, 256kbit RAMs
(like the 41256) work well in RAS-only-refresh mode, but all larger
RAMS (like the 1Mbit types) have 512 or more rows and you need
the CAS-before-RAS refresh logic.

BTW: which kind of upgrade did you use, is there some schematic
available online?

so long,

Hias

Yes, I remember that demo... we had a version of it on the 99/4A
written in Extended Basic...

Well MSX2 and later models didn't need much extensions to provide near
16bits performances, and this as early as 84-85. Too bad it wasn't
well supported outside Japan (the best games never were officially
imported) and that most games developped in Europe were simple
spectrum ports (cheap 4 colors conversions).

At least we obsess over things like our World Trade Center getting blown up
and thousands of people getting killed. British soccer obsess over soccer to
the point of being banned from competitions after their actions result in
numerous deaths. Pot calling the kettle black.

Numerous deaths? In recent history, tell me about the numberous deaths caused by British football fans? This will sure be interesting. And at a time when deaths did occur related to British football - for example the Hiillsborough Disaster and the Bradford City disaster - these were accidents and nothing to do with hooliganism.

The only numerous hooligan related deaths were the Heysel disaster in 1985 which left 39 people dead. This was at a time when hooliganism throughout Europe was rife, and not just a British problem. Lest we forget that on that fateful day that the Italians were also involved in violence, the only saving grace for them being that it was on the Italians that the wall fell, and they were absolved of much of the blame.

Well,
the type-in listing from Happy Computer magazine was for XL/XE computer only, since it uses RAm under the OS ROM. There is however a so-called 400/800 Version of Tb, also known as Frost Basic or Turbo Basic 400. Alas, it is appended to DOS 2.0 or DOS 2.5 somehow (meaning you have an approx. 160 sectors long DOS.SYS file). If you are able to un-append the TB from DOS and make it work in a stand-alone fashion, then maybe you have a go. (I am not sure if this TB version was just appended to DOS or if it was/is a special bootable version, just named DOS.SYS)...
-Andreas.

P.S.: E-mail me, if you want that frost-basic / turbo basic 400 version...

After you perform X=USR(32768), have the ml routine put your integer results into $D4-D5 (212-213, low-high) and your variable X will contain the value (0-65535) when you RTS back to Basic.

$CB to $CF are available in Basic, and the Floating Point registers also when you avoid math routines during the USR( execution and do not expect the data preserved back in Basic.

Meh... That's just a simple 'unlimited bobs' trick. It uses 3 frames,
flipping between each one, over and over again, while drawing a new 'bob'
(the sphere) into the current frame. It makes it look like an endless
collection of them are spewing out.

Now, as to how it got those particular colors on the screen at once,
that's a puzzler. Anyone care to share the magic? :^)

Good Idea,

maybe you can upload it into the ABBUC Infothek.
ABBUC Infothek is a virtual library with Books and Magazines on A8.
Everyone can upload content and change content.

The URL is:
http://www.strotmann.de/twiki/bin/view/Infothek/WebHome

If you don't like to register at the Infothek, please send me the PDF and I
will upload the file.

Best regards

Carsten

Don't know anything at all about soccer so can't comment. Still strikes me
as a rather obtuse comment given that the person the comment was aimed at
had decided a threatening letter was terrorism.

http://www.sportsjones.com/soccerbooks2.htm
All my facts are right. I and millions of other people saw the videos and
the interviews with your English thugs on tv and in print.

The problem with sarcasm is it is often wasted. Having dozens of people
killed at sporting events is not normal behavior except outside the USA.
Fans don't even kill each other at our football games. You have to go to
Mexico or maybe a Canadian Hockey game to even see it in North America. That
you find one behavior excusable but the American reaction to thousands of
people killed in multiple terrorist attacks<two WTC bombings, Anthrax
deaths, etcetera> unreasonable is of my point.

# 1282. Racing Cars for 8-bit

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-19 18:15:20 UTC
From: Mike Stepansky <design3d@2-scale.com>
Message-ID: <3E53BCE3.9D7E15CF@2-scale.com>
Source record: 23293

Let's review some of the racing car games for the Atari 8-bit computers.

Pole Position
Pole Position II (with Designer to design roads)
Speedway Blast (ala Rally-X in arcade; top view)
Speedway Rally (nice top view, multi-directional scrolling graphics)
Pitstop II (split screens, from EPYX)
Stealth/Landscape (? 3D futuristic carplane to collect the electrical hums on road, shoot down the dark tower at the end)
Ion Roadway (from APX software)
Getaway! (you are thief to collect money, to avoid police chase; top view scrolling)
ElectraGlide (from U.K.)

Any other ones that is not listed above?

mike

Source record: 23294

Atari 400 + Atari 800xl = Atari 1200xl

Likewise, Atari 2600 (VCS) + Atari 5200 = Atari 7800

(In case you guys didn't know that...)

What is the real reason for using preformatted 16 meg ATRs? Is that something
I should use for APE software?

Curious.

mike

You know, we could have done with you eight years ago, when every CPC
demo coder started coding crap, jerky "vector-ball" demos.

The Great American Cross Country Road Race. Pretty awesome game for
the time. Would change from night to day, you could blow up your
engine.

# 1288. Atari Auctions soon to expire/New stuff

Hello All,

My eBay auctions for SpartaDOS 3.2d and 1.1HS and the Advanced Programming Techniques book are soon to expire, so you'll need to act fast if you want to bid.

I have also taken advantage of eBay's free listing day for 'buy it now' items, and I've listed some quantity of stuff at below list prices: PPP CD, Digi-Studio, Print-Filer, and Screen Aided Management. I may add a few more items before the end of the offer too, so check back tomorrow as well.

The link is below (this will split on to two lines, so please copy both lines into your browser):

Hi,

I recently aquired a 64k ATR-8000 which the previous owner purchased new. It works, it's great but the system disk and CP/M 2.2 disk were thrown away some time ago by mistake. Anyhow, needless to say I am in need of the system software and the CP/M disks. If anybody can point me to a source to buy a new set or would be willing make me copies of theirs I will be happy to reimburse you for your time/trouble/materials/postage.

Cheers,
Steve

# 1294. Re: Surge Protectors/Ground

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-20 00:33:28 UTC
From: w_tom <w_tom1@hotmail.com>
Message-ID: <3E542258.7E277142@hotmail.com>
Source record: 23107

Cited are half truths advocated by ineffective, grossly overpriced, and undersized surge protector manufacturers. Rather than detail the so long list of half truths, instead, read a long but abbreviated list of technical problems, posted in the newsgroups alt.comp.hardware & sci.electronics.basics : "Is my surge protector good?" 7 Oct 2002

Where in HowStuffWorks is there any mention of earth ground? Earthing is the most critical component of a surge protection system! To sell grossly overpriced, ineffective surge protectors, they must avoid all mention of earthing. Did you address earthing for surge protection? No earth ground means no effective surge protection. That missing information alone demonstrates that HowStuffWorks forgets to mention critical information. A surge protector is only as effective as its earth ground. How many days of reading would you like to see to learn how inaccurate that post was?

Bottom line: a surge protector is only as effective as its earth ground. How to identify ineffective surge protectors: no dedicated connection to central earth ground AND avoids all discussion about earthing.

Lets see what those indicator lights really mean in more expensive surge protectors. After all, your original post thought that ground LED indicated something useful. Notice in scary pictures that all active components were removed from more expensive plug-in surge protectors and still a light claimed it was OK:
http://www.zerosurge.com/HTML/movs.html

Noted blunt, up front, and supported by generations of research and example - your effective and your least expensive solution is a 'whole house' surge protector. Many surge protectors throughout the house only enriched those who don't even claim to provide effective common mode surge protection. Where is your earth ground? Did any of those grossly overpriced (10 or 50 times overpriced) surge protectors even mention that one must inspect central earth ground? Of course not. They are not providing an effective surge protector. They even forgot to mention that common mode surges do damage. Therefore you will 'assume' it is effective protection.

LarryWhite wrote:

Hi, Steve,
I got mine used also with no documentation; much of the instructions are out there online - just not the CP/M stuff.

I believe the system disk was just a MyDos 3.? with a driver for the ATR's rs232 serial port. I booted up the CP/M disk once to merely a flashing cursor prompt and had no idea what to do next as there was no response to all I tried... If that was normal, I would attempt to dup it for you when you can direct me how to do it.

And Racing Construction Set, Deathrace, and something looking like Super Sprint (It counts down with speech I believe and was on tape from a UK company). There must be more (Speed King or Speed something. One is a motorcycle thing, but the other is a car game), I have to sleep on that a while.

## 1300. SAFRYLAND Found!

Source record: 23114

Steve,

I had the same problem but finally found a source. Go to this site:

http://www.gaby.de/sysdisk.htm

Send an email to Don listing the ones you need. He can provide you with
images that you can write to diskettes (if you have the proper hardware
and software) or he can make copies for you for a reasonable fee.

I got the images but don't have a hardware platform that will write them
to disk so I haven't been able to try them out yet. I'll email the
images to you also.

Boyd

FWIW: Guessimate I've heard is to emulate any processor is that you need
five times the processing power to emulate at the same speed. I still own a
native CP/M machine, 4 mHz Z80, and the performance is nothing to write home
about. Given that the 6502 is about the same processing power as a Z80 I
think you would find the performance too slow.

Okay, I fired up my 'real' Atari800 NTSC and it looked really crisp and
clean. Alot more like a standard terminal than the Atari font. No big
artifacting other than a slight pinkish color, but I think that was due to
the black background.
Overall it looked very nice!
If you need any other real testing done, let me know.
Mo

Okay, I'm scared now! I use several of these 'power strips' on my atari and other computers. I never leave them on, especially in a storm. No, there is no earth ground (well, they're three prong plugs- so maybe). So if I only turn them on in good weather and only while I'm using the computer, am I safe?

I don't believe it was mentioned that Indus/Future Systems also had a CPM setup
using the Z80 in the Indus drive. I can't remember for sure if you had to have
the Indus "RamCharger" board installed -- I think so, but I'm not positive.
What was the proposed Atari CPM (and other) expansion box-- the 1090?
Larry

Source record: 23130

Turning computer or surge protector on or off makes no difference. A surge protector only shunts (distributes) a surge to all other wires. They are called shunt mode surge protectors. One wire leads directly to electronics - the green safety ground wire. Surge can bypasses power switches and power supply to seek earth ground, destructively, via the electronics.

Effective surge protection has always been to shunt to earth before surges enter the building. Telephone lines already have such 'whole house' protectors installed in the NID that also must be connected less than 10 feet to the same central earth ground. Protection installed free by the telco. But AC mains is source of most all surges - no protection installed at service entrance.

Generally, surge protection also means upgrading the house central earth ground to, at minimum, meet post 1990 National Electrical Code (NEC) requirements. That earth ground rod becomes central earth ground. All incoming utilities must connect either direct to using hardwire (CATV, satellite dish) or via a surge protector (AC electric, telephone) to this central earth ground.

AC mains are the most common source of destructive surges. Home Depot sells two minimally acceptable 'whole house' surge protectors: Intermatic EG240RC or Siemens QSA2020. Cost is about $1 per protected appliance.

BTW, all homes absolutely require earth ground not just for transistor safety. That earth ground is essential to human safety. Worse case examples of failure due to no earth ground - the house exploded when electricity had to find earth ground via gas meter.

Chances are you don't need an actual Indus GT, but you may need a drive capable of enhanced and/or double density. Atari 1050 drives with double-density enhancement kits are somewhat common on eBay, so check there. Various used Atari retailers are also likely to have compatible drives in stock.

seems SO's across the board account for atari damage and loss. it is funny though that i was the benificiary of a SO's power and i ended up with a goldmine. i feel for the man who gave up what was practically a complete set of ATARI in almost all ways. mags,software, hardware. he knows who he is and i am so gratefull everyday. just had to add that in to this bit.

Looking to purchase/trade for a 320k-1mb upgraded XE. Prefer a machine with either the CSS OS or the APE OS ROM upgrades.

My 576k is now too flakey and I've reverted to my 256k XL - until I get time to crack the XE open and review the internals.

Once upon a time I was thinking of using a number of MUX'd Ataris to
simulate something like X-Window in the Unix/Linux world. :^)

The 'master' would, of course, still be the master (with the big hard disk,
or whatever; and from which the other machines (slaves) boot).

One 'slave' would be the GUI display.

Finally, each additional slave would be running applications.
The applications would listen to the GUI display for any keyboard or
joystick/mouse input, and would send graphical updates back along the MUX.
Just like X-Window! :^)

I never saw any sources but IIRC about 15 years ago I disassembled one
and changed it to my needs. Never gave my version to anybody else.
But if you don't get sources from somewhere on the net, I could look
whether I can find my sources somewhere. BTW, I wrote them in MAC/65.

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. I can afford to sell for less because I keep overhead down, avoid making promises I cant keep and avoid offering services I cant follow up on! So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org Or goto my Domain at http://BenSells.Atari.org or Call Ben@(503)256-9974! http://www.aracnet.com/~atari/numbers.htm Calling Hours and Info:

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. My customers love the speedy service! I also have lots of Atari Reference Books. Which I can Mail by Book Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Source record: 23053

Does anyone know of a suitable inkjet for the 8-bits -B&W only would suffice. This would be connected via a Centronics type interface. I have an Epson Stylus Color 400, but despite all efforts at writing a printer driver, it won't work correctly (ignores nearly all commands).
Thanks in advance,

Chris Davis

My Canon BJC 4200 prints everything (text) I can copy to it. But it skips two lines of text between sheets of paper. And DaisyDot works fine if you can live with the fact that the round dots a dot matrix printer prints are now small black squares. (meaning: it looks horrible)

But if you want it, I can send you a document I have that mentions many commands for many Canon printers.

I used Ataridos 2.0s and it went okay. To unpack the arc file I used the emulator and unarc.com (available from spudster). Copied the files to my desktop which was set as a virtual harddrive. Then I put those on a floppy and sneaker net'd them to my 486 APE box and ran it on the real Atari with my SIO2PC cable.

# 1344. FS: Atari SX212 modem

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-21 16:30:00 UTC
From: Greg Menke <gregm-news@toadmail.com>
Message-ID: <m3fzqhppfb.fsf@europa.pienet>
Source record: 23057

Atari SX212 1200 baud Hayes compatible modem with power supply. The modem has both the standard 25 pin DCE serial connector and an SIO interface, seems like these units were sold in 1988. No users manual, but it is in the original box. It worked fine the last time it was used, but I've not tested it. Its fine cosmetically.

I'm asking $10 to cover shipping, first come first served.

Thanks,

Gregm

BBSXPRESS, I think it became public domain.
Anyway, it is at ftp.spudster.org, under telecom
and unclassified txt files (the docs I guess). Look
for bbsx*.* BBS XPRESS PRO is still sold, owned
and supported by Video 61.
I can't find the old AMIS BBSes. I guess they're around.
They were BASIC BBS. My first BBS was MPP AMIS by Matt Pritchard.

# 1348. Re: bbs software ?

Uhm. I didn't mention Carina and BBCS, they are
also at ftp.spudster.org, but I don't recommend them.
I heard the later Carina was stable, the early version
I had was unstable. BBCS was very unstable, at least
for me. BBSXPRESS never crashed, always worked flawlessly.
Russ

turns out this Ilisp/65 was no longer being distributed by datasoft in chatsworth. Antic picked up the product and distributed it for Special Software Systems. it is in a number of the antic catalogue's. this makes me think that it should be easy to track down. there is an interim between now and 2004.. when the projected oric port is done as xlisp.. anyway this is my thinking.

I think all the cheap inkjets today are 'Windows'
printers. That means that Windows has to do the
fonts, has all the smarts. The printer doesn't know
the alphabet. Older printers have built in fonts, at
least one font (courier or something).
The Atari laser printer was like today's Windows
printers, it was stupid, all the printing was handled
by the computer, the printer just knew how to print
dots.
Something like that.
Get an old deskjet or cannon or brother or whatever
that was before the new types.
I think modems are like that today too. You can't
get an external Winmodem, but internal ones I guess
don't have any firmware in them, they are strictly
hardware and only understand bits, and bytes, no
AT commands and stuff, I think.

Well, I have a Xerox XJ6C and it works fine. Like somone else said, most
currently available printers are 'WinPrinters' - when buying one make sure
it can print from DOS and/or comes with DOS drivers, since if it does it's
likely it'll work with the A8 too.

## 1358. Idea : All-in-one ATARI

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-22 06:41:05 UTC
From: blutrunst@yahoo.de
Message-ID: <7d24ed2c.0302212241.4584ce40@posting.google.com>
Source record: 23071

Think of a PPC-based machine which emulates all the ATARI computers :

basically an ATARI ST/STE/TT , which is quite "easy" to emulate and
had a better-than-DOS/Windows GUI in its time

with modern GEM-version and LINUX.That means,when you power it,youï¿½ll
have an ST/TT or Falcon or a LINUX machine.

plus

ATARI 400/800/130 XL/XE
ATARI 5200
ATARI 2600
ATARI 7800
ATARI Jaguar
ATARI Lynx

Software-only emulation or "real" hardware on cards.For example -
someone designed an "ATARI 2600 in 1 chip".This should be possible to
add as a cart.

This system would be 7 ATARIs-in-One ,could sell quite a few more
units than just a new 8 Bit.

Only problem :Getting the name "ATARI" for it.Otherwise it would be
possible in a few months.

It's interesting. I've been following H-P inkjets for a while, and I can only assume that the other manufacturers went through similar stuff.

In a sense, we were spoiled with dot-matrix printer manuals, which usually contained not only all of the necessary codes, but a means for designing and downloading fonts from the Atari (or any computer, for that matter) to the printer.

There was a time when you could get all the codes for a specific H-P model only if you went to their Web site and knew where to look. I was able to get the codes for an H-P 660c. But when I looked at the strings that would have to be sent to it from an Atari, I knew that few of us would be willing, or even able, to imbed those strings in something like Atariwriter. Keeping it monochrome might help a little, but not much. As for writing a driver, well, that would be even more complex.

Now it's pretty near impossible to get the codes for any specific inkjet printer. And even beyond that, if you look at several H-Ps in a series that were released at about the same time and had the same general appearance, you'd find that some came with drivers for DOS (which would have helped Atari people) and some didn't; some could use USB and parallel connections at the same time and some couldn't, etc.

So the advice to find an older, monochrome inkjet is valid, but not a guarantee of success.

Take care.

The advice on finding an M.S. Dos compatible printer is good advice. I did some looking about a year ago, and IIRC, portable units ($$$) were the only current ones that I found then to be M.S. Dos compatible. You will probably have to contact the maker's tech/sales support to get real solid info. I also found that Laser printers were more likely to still support Dos.

The early inkjets nearly all supported Dos, and at least a couple of the HP models could use an Epson FX emulation cartridge. I had one of those -- a DeskJet 500. Those can be picked up for very low cost.

Of course, you mentioned "compatible inkjet", but depending on your needs, have you considered printing through APE? On Win 95 or Win 98 it is quite viable. Atari fonts are available for Win and (I think) Mac. I usually use Courier or Times Roman, but if I need to print the special Atari characters, I use the Atari Fonts -- usually "Extra Smooth".

The team at AtariArchives.org is thrilled to announce that the full text of the classic book _The Computer Controller Cookbook_ by Tom & Kelda Riley is now online at http://www.atariarchives.org/ccc/

Published in 1983 by Creative Computing Press, this hard-to-find book shows how to build your own controllers for Apple // and Atari 8-bit computers.

Chapters include instructions for building an airplane wheel, sketch pad, race car steering wheel, foot pedals, sound-activated controller, and joysticks. There are also chapters on rebuilding paddles and joysticks, converters for using Atari joysticks on Apple computers (and vice versa), and more. Chapter 14 is an electronics tutorial that tells how to adapt the controllers for use on VIC-20, IBM PC, Radio Shack, and other computers.

This is the 11th classic computing book available at AtariArchives.org.

Other than the Antic article, which belongs to Antic and Matt really, anyone can distribute anything I have ever done for what ever purpose they wish. Some of the projects, such as the 80 column adaptor or dual Antic mod, are a little advanced for most casual hackers... And, I can't find a lot of the reference material for many of them anymore - not easily, anyway.

I can send you a scan of the article if you like.

If you can find an old DeskJet or DeskJet Plus and an Epson cartridge, that works pretty well. Look on E-bay, maybe.

I use a LaserJet 4P on my 8-bit. This printer allows me to set the default font from the operators panel on the 4P and print text from any Atari program in that font. I wrote a driver for AtariWriter long ago that printed to an HP PCL printer (either laser or inkjets).

What are you trying to print?

The HP printers all seem to use PCL for printing, which hasn't changed a whole lot over the years. I have been able to even get color off of my old DJ500C on the 8-bit using the DJ Tech Ref Guide from HP (HP part number C2121-90101).

Look at :

http://cgi6.ebay.de/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=klassische-videospiele&sort=3&page=11&rows=25&since=-1&showpics=1&stab=0

lots of boxed XE games on ebay , like Airball,Rescue on Fractalus,Ballblazer,Crime Buster,Thunderfox ...

All new + shrinkwrapped.

this is ebay.de,but I can sell worldwide.Prices are in Euro , but 1 Euro is just a little more than $1.

All games are NTSC and PAL compatible and have English manuals !!!

Yes.I think the 2 "main ATARIs" are the ST and the 800.They should be
there as "hardware" on a card.

The 5200 is basically an ATARI 800.

A 7800 on-a-chip should also be able to run 2600 games.

It would maybe possible to create such a system - with the MIDI port ,
so that it would be possible to use the ST MIDI software.

Such a computer would be great for MIDI , for DTP , word processing
etc. in its "ST part" , and great for games in its "800 part" or
"console part".

The problem is that a new ATARI 800 (65816-based) would never sell
many units.I donï¿½t want to make big profit , but itï¿½s necessary to
sell a certain amount of units to get parts cheap enough produced.

Combined with the ATARI ST and all the consoles , this "multi
computer" could be intersting even as a modern system - because the ST
was always better than a DOS PC in its days.Then it could sell enough
units.

The ST is a quite "simple" computer without much special hardware.The
ATARI 800 XL is far more complicated with its custom chips.Only STE
and Falcon and more advanced custom chips (Blitter , DMA Sound , DSP
in Falcon,Scrolling).

Maybe the best idea would be to make an ST/linux - based computer and
offer all the other ATARIs on cards to add to the system.The ST market
is the biggest , I think Lynx the smallest (since its games are only
interesting on the handheld).

So the basic computer system would be an ST/Linux system and all other
systems would be emulated by software.Real hardware emulation of all
other systems could be added with cards.

ST and all other OSs are small and could be held on ROMs = no booting
of Linux as in using of emulators.Switches could be made to change
between the computers.

As Iï¿½ve said , only 5 cards would be needed - ST, ATARI 800 XL (includes 5200) , ATARI 7800 (includes 2600),Jaguar and Lynx.

Only problem : ATARI 7800,5200,Jaguar,Lynx,XL all have different cartridge slots.That means , using carts would not be possible except each card had its own slot.

Hi Ron-
> Have you found a way to access the entire A8 font? <
No, I do use the updated font (V1.1), and it is very adequate for my purposes, but you are right, there are still things that it won't print correctly. I pretty much only print text and program listings, so 95% of the time, I just use Courier. (Besides, the Atari fonts take lots of ink :-)

There is at least one Windows font editor that allows you to construct or edit fonts. It is from a person in the Netherlands, IIRC, and called the "Font Creator". It looks like a really solid product, but my priority list never seems to get to "fonts".

IIRC, APE for Dos would also do printing chores. Did anyone ever develop any special fonts for M.S. Dos? (And back to a Dos-compatible printer.)

Larry

The Stylus Colour 400 is fully FX-80 compatible. I have been using one on a MegaSTE and Falcon for ages. For First Word and Word Writer I just use the Epson LQ driver, it works OK. I would imagine thee 8-Bit would be the same.

It would need to be aimed at the Falcon if you wanted to market it.
Most of the really good software uses DSP. Most everyone I know has
a TT030, Falcon, Milan, of Hades. An ST equivlent would be rather
limiting.

Yes , a PPC - based Falcon + an 680x0 on a card.An original ST could
always be emulated by software only.

I think this could be a good all-in-one machine.The main system is a
next-generation Falcon (ST) and the 8 bits could be added on cards.

This would make such a system great for serious users - CAD,DTP , MIDI
,Word Processing and for gamers (the ATARI 8 Bit wasnï¿½t really
designed for word processing/DTP etc. , but the ST/TT/FALCON were
better than PCs at their time).

BTW : Anyone knows if thereï¿½s technical information about the Falcon
(the chips etc.) on the net ? 8 Bits are documented well.

Blutrunst

Most emulator sites have links to docs.

## 1380. Atari 800 troubleshoot

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-23 06:12:23 UTC
From: WeedWarrior <mlangeonline@yahoo.com>
Message-ID: <v5gphdt2k61s7e@corp.supernews.com>
Source record: 23093

I have an Atari 800 that is not correctly reading any "up" movement on a joystick. I have used another computer and two controllers to verify this.

Is it possibly something simple like one of the resistors at the joystick port or should I replace the mainboard?

Any help is appreciated,
Mike Lange

Would you just grow up. Ben is just trying to let the community know that there is still a source for atari related items. Having met & purhcased from him on numerous occasions, I found him to be one of the few good resources to help maintain my collection of atari-abilia (CES 2600, 7800, CX800, 800XL, Jaguar, & 3 1040STfm systems).

If you don't have anything constructive to say, then please slither back to the alt.spank.my.ass news groups that you apparently are fond of.

Source record: 22998

You may get quite a few opinions about this. Briefly...
They are all *excellent products*. Atari folks had cause to celebrate when these products became available -- we no longer had to face the barbs from the C64 folks who had a (slightly) slower clock speed, but a built-in Basic that arguably ran 2-3 times faster than A8 Basic.

Basic XE has the most features, including allowing use of part of an XE's extra 64K for program use. No other does that.

Turbo Basic XL (disk) is free and has lots of features + more program space than regular A8 Basic. It is the fastest, and has a nice compiler, but no stand-alone compiled progs. Unfortunately when you type DOS, you lose your program and must reload TB. This may not be true in the new cart version. (?)

Basic XL has a nice runtime package and a few extensions in its Toolkit. Since it does not normally use the memory space under the OS, it probably is the most compatible product. (Yes, Frost Basic can be used with 800's and there is a Sparta version.)

Both Basic XL and XE are in Supercarts and can be turned OFF, although re-starting them causes a cold start under most conditions. Basic XL and XE both have Microsoft-type String Arrays + big strings, so they have the best of both worlds. Atari folks have always made the point that you don't really need string arrays, since you can manipulate the strings with the subscripts, but if you need string arrays, the "real deal" is handier (IMO).

I guess if I had to rank them, it would be in that order, but they are all great, and I use them all at varying times.
Larry

Worst case if it isn't something simple like a bad solder joint would be the
6520 PIA chip is bad. If that is the case then it would be easiest to
replace the chip. The PIA chips are off the shelf devices made by several
manufacturers and usually about $2. The 6820 and 6821 are compatible devices
is you can't find a 6520.

# 1387. MyPicoDos 3.0 available

Hi!

I just uploaded MyPicoDos 3.0 to my homepage

http://www.horus.com/~hias/atari/

MyPicoDos is a "game DOS" which can load COM/EXE, BIN and BAS files
and it supports MyDOS subdirectories.

New in this version:
- support for SD and DD (hard-) disks from 720 up to 65535 sectors
in DOS 2.x and MyDOS format
- MyPicoDos supports loading from D1: to D8:
- MyPicoDos is now GPL'ed and comes with full source code

so long,

Hias

# 1388. FA : 100 boxed , new ATARI XEGS/XL carts

Just bought a Max-a-Flex Exidy Arcade machine from a guy on Ebay this weekend. The Exidy is nothing more than a 600XL running a cart-based game. Other than the 600xl on the inside, the outside looks like any other full sized Arcade machine.

Here's my idea: I have an old 486dx2-656 Compaq all-in-one PC (the video, base, etc is in one unit) that I'm going to mount inside the chassis. Upon powerup, the PC will load specific ATR images to the 600 or 800xl (I will probably pull the 600xl and mount an 800xl or 130xe instead).

Imagine playing Alternate Reality from a full sized arcade machine! Cool, eh??

Will then use PCAnywhere for DOS to manage the pC thats locked inside the unit.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

## 1399. Re: Request: Can someone test this on a real A8 please?

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-24 11:42:26 UTC
From: NoOne@FakeEmail.invalid
Message-ID: <932C4E955PrivacyLabs@209.143.0.11>
Source record: 23013

Thanks again to Solar Influx and the others for the feedback. I am limited in what I have to test with so it is good to know how it works and appears on other types of systems.

Originally I was going to use it inside of ATOS but it has been sitting around on my drive for a couple of years. So then I thought if I'm not going to do much more with it I might as well clean it up and release it so others can examine it and perhaps use the technique to make something out of it. I think the proportional font and artifact filter creates the most pleasing text display that I've ever seen on the A8. Maybe it could be used in a text processor like a micro emacs or micro vi?

That might be a good question to send to the emulator authors. That
is, "Why can't I use (such and such) size ATRs that were generated with
(such and such) software?" It's been a few years since I made those ATRs,
but I think I remember having to tweak the ATR header with a hex editor in
order to get them to run in some emulators. It's a bit fuzzy now.

Howdy James

> I will probably pull the 600xl and mount an 800xl or 130xe instead

Why not upgrade the 600XL? As far as I know (and I only know the Max-a-Flex from this site http://www.arcadecollecting.com/boulder/boulder.html that somebody pointed out once) it doesn't come with a keyboard or top half of the case.

Can you show me a copy of this rule?

There was a informal group enforcement of no commercial posts back in the
80's. Much of the internet was being run on government subsidized computers
that allowed no commercial posts. There was also the .biz hierarchy for them
to use instead of this hierarchy. AFAIK there never was an official rule
against commercial posts but I would welcome the information.

There are rules for some of the newer groups like the programming, binary,
and announce, just for the older groups they never had a charter.

This all changed with the Al Gore legislation that created<sic> the internet
as we now know it.

I believe there's a small set of folk who 'imagine' they moderate /
control the group, I imagine it's against 'their rules' rather than a
real rule.

Of course they could prove otherwise and show the info as you say.

## 1414. atari++ 1.19 released

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-25 09:38:20 UTC
From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <b3fdic$aqs$1@mamenchi.zrz.TU-Berlin.DE>
Source record: 23027

Hi folks,

The 1.19 of the atari++ emulator is now available for download at the
canonical location:

http://www.math.tu-berlin.de/~thor/atari++/

Concering the features, quite a lot changed since then. Here's
the list of what happened:

Atari++ 1.16
- Added support for .dcm images and for .gz compressed
images of all kinds in general.
- Fixed an ANTIC timing problem for LMS instructions for
text-based mode lines.
- Fixed the directory requester of the GUI, again.
- Fixed the cycle count for several CPU instructions that
seem to have escaped earlier test.
- Added more autoconf tests for working compilers, most
notably for working exceptions and for icc specific
compiler setttings.
- Added autoconf specialization for the intel icc
compiler for better performance.
- Made several adaptions and stronger typing that
might help porting the code on other compilers.
- Several other minor bugfixes.

Atari++ 1.19
- Changed the licence conditions to TPL (almost identical
to the MPL).
- fixed a fatal bug in the SDL audio output that could
have caused buffer overruns.
- Fixed audio sample counter to reduce complexity.
- Modified RT8 cart support. The current emulation model
makes a bit more sense than the old implementation.
- ANTIC modeline speedup by using a different lookup table
concept.
- Changed the WSYNC logic for CPU and ANTIC.
- Simplified GTIA/CPU cycle coordination.
- POKEY audio generation makes now use of some LUTs to
speedup the polycounter usage.
- Added proper error handling: Run time error conditions
are now properly reported by a graphical requester.
- Added a warning log: Warnings get now reported within
the GUI and not on the command line.
- Added a licence agreement requester.

- Added an interface for SDL joystick emulation.
- Improved compatibility of the code by adding even
more autoconf tests.
- Split the CPU instruction build-up into several
subroutines to avoid some branch-distance problems
on some platforms.
- Added a requester before shutting down the program.
- Made handling of missing Os ROM images more user
friendly.
- Added a flag to disable the monitor for novice
users.
- Added a pretty-printer for the command-line help.
- Removed an unnecessary window-pop up that sneaked
into the code in 1.18.
- Implemented precise POT reading emulation for
POKEY.
- Modified and fixed boot loader for binary image
files.
- Fixed BASIC Rom handling on an error.
- added various workarounds for popular compiler bugs.
The existing code should be easier to port now.
- Added abstraction layers for time and curses
includes.
- The OsROM layer will now check a "roms" subdirectory
for missing ROM images automatically.

Happy downloading!

I'm also waiting for ideas how to improve the emulator further as I'm
currently running a bit out of ideas. It currently performs quite nicely
and is in a state near where I wanted to have it.

So long,
Thomas

> Will there be SpartaDOS support in a next version?

Maybe :-) It depends on how much time I can spend.

I just had a quick look at the sparta dos disk format docs,
and it's a lot more complicated than the DOS2.x/MyDOS format.

Especially storing the sector link table requires memory for
one additional sector - this could get tight with loading
BIN files (which sometimes start as low as $480).

Well, let's see :-)

so long,

Hias

Well,
- Death race by atlantis (or another UK company)
- GACCRR by Activision
- Pitstop 1 (on disk, tape and cart) by epyx
- Racing Destruction Kit/Set by Activision
- grand prix simulator by codemasters
- ...galadega by ?!?
- another car race, with 1st person perspective and a separate audio
cassette for car/motor sounds (I don not remember its name right now)...

-andreas.

Uses cart + disk thats a little awkward. without the "fast" command it
is almost as slow as A8 Basic...

>
> Turbo Basic XL (disk) is free and has lots of features + more program space
> than regular A8 Basic. It is the fastest, and has a nice compiler, but no

For A8 Basic there was Mem.SAV - this can also be used with TB. Just
goto DOs (after you loaded Mem.SAv previously) and when you want to
leave use run at adress 2080. this may not work everytime, but mostly it
does. you have to avoid memory
"destructive" things (like copy, etc.) of course...

>
> Basic XL has a nice runtime package and a few extensions in its Toolkit. Since

Well,
I don`t think there is a need to support sparta/bewe dos format with
mypicodos. there is already the bewesoft program "Micro-sparta-DOs"
which is very similar to Mypicodos and in fact does the same (loads any
ML-file, 720-65535 sectors, single/double, with/out high/ultra speed,
etc. etc.)... -Andreas.

Here is my list of racing games / car games on atari...

Pole Position
Pole Position II (with Designer to design roads)
Speedway Blast (ala Rally-X in arcade; top view)
Speedway Rally (nice top view, multi-directional scrolling graphics)
PitStop (Epyx)
Pitstop II (split screens, from EPYX)
Ion Roadway (from APX software)
Getaway! (you are thief to collect money, to avoid police chase; top
view scrolling)
ElectraGlide (English Software)
Great American Cross race
Racing Destruction Set
Death Race
Speed King -
Speed Ace - Zeppelin Game (MotorBike Racing)
Talladega
The Last V8 (mastertronic)
SpeedRun (Red Rat)
James Bond 007
hazard run
milk race (bike racing simulation)
Kick Start (motorbyke racing game)
Motor Cross
Spy Hunter (Sega)
FireChief (English Software) Drive Car to put down fire
Action Biker (Mastertronic) drive bike to collect items and complete
tasks
On Track
BMX Bike simulation (CodeMasters) Race your BMX bikes around tracks
GrandPrix Simulator (CodeMasters) lap car racing
California Run
Dearh Racer (toney coacher 1987)

Well, this isn't real mature way to respond but I can understand the
underlying frustration behind it too. I hate SPAM, especially in newsgroups
but Ben does have a right to post what he wants and you have the equal right
to filter/killfile his posts.

Just my 0.02 cents worth.

Just a question about the better cart games on the 800xl as opposed to the 600xl statement... I thought it didn't matter, as the memory was in the cartridge itself so whatever works on the 800xl should work the same on the 600xl.. is this right? Just wondering if I had missed something somewhere... :)

It is as of now. I hadn't done anything during the whole licensing
thing, but now I'll get back on it. I'm eager to get Thomas's latest set
of changes too, because I think it's going to fix one or two of the
issues I ran into!

I have everyone's info, so I'll be back in contact when it's ready for
any formal testing.

I'd like to see the rules also.

There couldn't be any rules if cowards can post using "Anonymous" and use
vomit vocabulary.

Nevermind the rules,

What about the unwritten rules of basic human conduct. Nobody has ever even so much acknowledged the anonymous poster as being "right" or justified. There is however a good number of high profile atarians who think that Ben's behavior is flat out wrong. Most of the advertisements in this group are from where they belong - NONCOMMERCIAL ENTITIES. Being noncommercial they don't have an advertising BUDGET. However if anyone has ever started any sort of business, advertising should always be in the budget. If there's no budget room for advertising, give up. Frankly I'd rather see BS fade into the darkness then endure his endless drivel. I'd rather sacrifice an Atari dealer... I'd rather become a non-profit Atari dealer myself. Why? Because that's the way I feel. Wake up people? Ben is completely ignorant of everyone. I can only recount 1 single response to anyone regarding the huge amount of challenges to his posts, and that post said something along the lines of "I'm mentally challenged". Yet Ben does indeed manage to write well worded essays on why you should shop from him. I think it's a load of shit, everything. I'm so sick and tired of people being incompetent, not because they really can't do something, but because they are lazy and make silly excuses. And excuses are all that I think is going on.

Fact: if ben can maintain the website, maintain the catalog, write essays, carry (sometimes large) boxes to the post office to ship and do things like that, he could also do MANY other things to supplement his income. It means he should play by the rules and at very least respond to people questioning his practices. I mean after all, as an Atari retailer, how busy could he be?

This all just bothers me on so many levels. I HATE it when people say they CAN'T do something... it's crap.

Mark
http://atari-source.com

PS: my opinion may be blunt or unfavorable but understand I'm the type of person who must have something proven to him before he believes it. I don't believe ben has a mental disability because nothing of any sort has been said to prove it, however I do believe Ben is an ignorant ass and he has certainly proven that. How can you challenge that? Wah wah, he's one of few. Who cares? It's a business and if one business advertises here then every small software developer and commercial entity should be allowed to advertise here. That's the rules right? Atari may be small but don't you think this newsgroup would become rather unreadable rather quickly right?
The fact remains, there's so many more forums and even BETTER ways for him to advertise in this one. Ben chooses not to so why shouldn't we bitch?

# 1449. Re: ADV: Atari Sales, Service & Support!

Those who say Ben is wrong in effect are saying they read every message posted. After all, they are unable to make the decision to just avoid it or even block it. Anyone who reads every post needs therapy. AND.... once they've read a post from Ben decide it isn't something they are interested in and then go ahead and feel they must read succeeding posts from Ben, even though the Subject line clearly states its an advertisement..... gives new meaning to retardation.

I LIKE IT!

Email spam is horrible. You set up a mailbox and get all kinds of junk.
You can protest it, filter it, whatever, but it keeps coming. Newsgroup
spam can be just as bad, particularly when it's commercial stuff aimed at a
wide audience. But face it -- we "opt in" when we subscribe to this group.
In addition, what we have here is a newsgroup devoted to a small group of
followers of an orphaned, strictly hobbyist's line of computers. In the
overall scheme of keeping this line of computers and hobbies related to it

alive, it seems like a major war is being fought over a square inch of arid, totally useless land.

I gave up my Atari hardware a while back because I ran out of time and room for it. Since then I've followed as much of this newsgroup as I can and I continue to use (ugh!) emulation to satisfy my 8-bit cravings. Ben Smith can sell me nothing at this point. But I have to be very critical of those who oppose Ben's posts. We're not talking about a PC or Mac newsgroup here. Anyone who continues to support the Atari 8-bits commercially is not going to become a millionaire and knows it. Maybe Ben would rattle fewer cages if he posted only when a new item became available -- sort of the way Lance does it. But, for reasons of his own, he persists. How much emotional effort can be saved by just ignoring or kill-filtering the messages? Is this really something to go to war over? Is this question of whether it's right or wrong for Ben (or anyone else, for that matter) to put commercial posts in the newsgroup the burning issue of the world today? Will it save your job, your marriage, your sanity if you take a stand publicly and produce gallons of stomach acid in the process?

There are real issues to be discussed in maintaining a shrinking community, and they can be, and usually are, discussed dispassionately and intelligently. Let's not make the Ben Smith thing the straw that broke the camel's back.

Take care.

Alan

Take care.

It overlapped two Antic screens on your system. You can have a GR.0 screen of text on one and color blocks on the other. Or, Luma on one and color on the other. It is basically two Antics, each with its own memory, that are synched on the VBlank pulse.

scott adams adventure international release "STAR
FLITE 3.5" is now availible on cartridge for all atari
computers with at least 48k of ram.
thanks to scott adams for his kind permission to
video 61 for rerelease all of his games onto cartridge
format.
thanks to the many talented, dedicated atari
programmers who ported this jewel to cartridge format.

hmm.. what was to do at all on eight bit stuff. converted superarc and the fmdemo arc to 5 1/4, turned off the pc and then i unarced it and had no errors there. but then i got an end of file error. then i used spartados and it worked. so either pkunarc isn't good or wrong density? if you do not know , the file has been changed to fix a pathname..i am getting this message in out of thread context so i forget the content allready expressed in there. so try superarc to unark it to single density disk and use spartdos and make sure you have d/l'ed the new file. it is a nice work definately a very pro display most unique.. i design scrollers that just scrol graphic characters in geometric sequences produced by deeply nested loops. wish i could try it with this.. need to learn a bit more..

Anyone who reads every post needs therapy.

[snip]

I do? Well, I guess I need a life because I _read_ all the posts on this newsgroup AND the 8-bit mailing list. I'm not active with my equipment just yet, but I do like to stay informed.

-Bob

# 1456. Re: WTB 8-bit hard drive

Newsgroup: comp.sys.atari.8bit

Does it come with the interface to hookup to a 130XE? What would you be interested in trading for? I have a few extra Atari items around here.

Ron Pothier

# 1457. Atari BBS in California?

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-27 06:55:00 UTC
From: Ron Pothier <cowboy.ron@verizon.net>
Message-ID: <8Di7a.35631$_J5.29133@nwrddc01.gnilink.net>
Source record: 22920

Does anyone know of any Atari boards still running in Southern California?
It would be cool to find a few die hard sysOps still around.

Thanks,
Ron Pothier

## 1458. 130XE video problem

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-27 13:31:38 UTC
From: peterhjr@yahoo.co.uk
Message-ID: <7729e40e.0302270531.1f1ae28f@posting.google.com>
Source record: 22921

I picked up a cheap 130XE (all by itself, though) and it works like a bomb except for one small glitch.

Depending on what value is in location 710 (playfield 3) the background will either remain black or turn a yucky shade of dark orange. This also affects other colours on the screen as well.

The glitch occurs with 128 different values: the ones corresponding to BASIC's setcolor 3,2,0 thru 3,2,15 and 3,3,0 thru 3,3,15... and so on; with colours 0,1 4,5 8,9 10,11 and 14,15 not affected.

What the hell is going on?

..PeterH

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. I can afford to sell for less because I keep overhead down, avoid making promises I cant keep and avoid offering services I cant follow up on! So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org Or goto my Domain at http://BenSells.Atari.org or Call Ben@(503)256-9974! http://www.aracnet.com/~atari/numbers.htm Calling Hours and Info:

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. My customers love the speedy service! I also have lots of Atari Reference Books. Which I can Mail by Book Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. Howdy folks

I've seen a lot of demo's where you just press SHIFT (no other key) to get to the next part. How do they do that? Can the same be done for CONTROL?

Hi,

> I've seen a lot of demo's where you just press SHIFT (no other key) to get
> to the next part. How do they do that?

Bit 3 of pokey register $d20f (SkStat) contains the state of the shift
register.

> Can the same be done for CONTROL?

No, as there is no similar bit. Control can only be detected together
with a "regular" key.

Greetings,
Thomas

# 1465. Atari eBay auction - selection of mags

Newsgroup: comp.sys.atari.8bit
Date: 2003-02-27 21:25:51 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1046381166.93447.0@iris.uk.clara.net>
Source record: 22928

Hello All,

I forgot to post last week the fact that I have put a selection of Atari mags up for auction on eBay. There's only a couple of days left to run on it now. I've also got lots of other non-Atari stuff (mags, ZX81 stuff, etc.) on there too.

The link is below (this will split on to two lines, so please copy both lines into your browser):

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=deangarraghty

I know what you are talking about. It was a variation on Hammurabi.
Only instead of running a kingdom in Sumer, you ran a small Italian City State.
It was called somethinlike Santa Vittorio, and the marketer was Creative
Computing games.

Was this modification published somewhere that I could get ahold of it? It sounds interesting... the only drawback, as with all modifications of this nature is that code has to be specifically written for it.

Any applications where you may interlace two screens during VBI could benefit from this upgrade. Did you build in seperate access to extended memory for each Antic chip, like in the 130XE? That would make it a little more practical, I think.

"Bob Woolley" <ataribob@directvinternet.com>:

Hi,

I am trying to find out the name of an atari game from the early 80's the game had a man that would go from cave to cave and pick up treasures a thief would be chasing you and stealing the treasures if you shot the thief he would drop the treasures and run , if the thief hit you then ytou would lose some of your treasures.

Any one know the name of this game???

Imran

# 1471. new tools for myide

Message-ID: <b3ntmi$32c$1@reader11.wxs.nl>
Source record: 22934

Hi Folks,

Today I finished version 1.0 of MySwap.

It works great with myIDE 3.0 AND 3.1
with this tool you can swap your partitions between D1..D8

There is a file version, and a disk version available. Especially the disk version might be VERY interesting... I suggest you write this disk version on IMAGE 1 of the MyIDE images. You always be able to switch your partitions without disconnecting your harddrive etc.

Wanna have the stuff? Mail me!

Marius

Micro Sparta Dos is really cool:

BUT (!!!!!)

It is NOT compatible with myide. It seems to do have some kind of own
sio-routine (even with high-speed sio off) ... and that's why myide is
getting confused.

I'm gonig to write a new game-loader for spartados.

Marius

They have. It's called Orbiter, and can be found at
http://www.medphys.ucl.ac.uk/~martins/orbit/orbit.html

Best of all, it's free :-D

Steep learning curve, but navigating around (and docking with) a space
station is really cool. Not a fully mature program (you can fly right
through the space stations if you miss the docking port!) but overall
worth the time to check it out -- and it can be played right from a CD
if you choose to burn it there.

I still play Activision's Space Shuttle from time to time. Lots of
fun. And to Andreas Magenheimer -- yes, you do have to fly the
shuttle into orbit, and you do have to land it at the cape.
Activision managed to cram a LOT of detail into that game.

Actually, one of the things I liked about the hack is that you didn't need a lot of special code to use it. You could swap ANTICs and just write to it as if it were stock. Sort of a screen flipping with no flicker - you just need a screen draw routine for each screen. The main ANTIC used normal memory and the ghost ANTIC had his own separate RAM that was write enabled with ANTIC. No VBI is required per se - each ANTIC/GTIA is always active and producing video from its own DL and RAM, enabled or not (sorry, no DLIs or P/M graphics are available in the ghost display).

The mod was published in mid 1990 in the SLCC Journal.

I was thinking that a better hack would be to sync up two complete machines (or three?) Not so much wiring involved to do that - maybe two ICs in each box.....

Be pretty cool to feed three machines into the component jacks on a monitor - one for LUMA and two for COLOR.

I was wondering if anybody knows if the XEP80 80-column adapter can be mounted internally? Just wondering, having it hooked up to the joystick port looks rather stinky.

Cheers,
Steve

Hi Steve-
Certainly you could "hard wire" it, but the actual board is quite large to be an internal mount. When I use mine (rarely) I just set it on top of the disk drive stack.

Actually, the whole thing is pretty stinky -- not one of Atari's better efforts,
and not the least of which was it would only work with a few composite monochrome monitors. (Most monitors would "overscan" an lose text at the top/bottom and/or sides.) Do you have a monitor that displays its output correctly?

The Bob Woolley TTL mod worked good when I had a TTL-capable monitor. I guess I should try it with my ATI (All-In-Wonder) video card. It would not work correctly with a JAM!! or Instant TV.

Remove the back of the keyboard (about 22 small screws). Carefully remove the Mylar sheet. It is actually a large sheet folded in half. Carefully unfold it. Work slow and don't tear it. It will be pretty well stuck stuck together. Gently wipe with a clean dry cloth and put it back together. Make sure the Mylar is aligned on the two plastic guide posts before reassembly. I fixed 3 with the same problem just last week. They had been stored in the attic and the heat had caused the Mylar to stick together. Paul

# 1494. Atari810 update 1.4d

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-01 18:14:43 UTC
From: Dan Vernon <newsgroups@retrobits.net>
Message-ID: <b3qtb8$282$1@news.chatlink.com>
Source record: 22957

Just posted a new version of Atari810 (1.4d) to my website. Among other improvements, the UI now supports "skins". In addition to the 810 skin that many have grown to love (or hate!), you can pick a 1050 skin (not too pretty yet, sorry to the 1050 fans out there), along with several more "standard-application" looking skins, several of which are resizeable, have larger fonts, etc.

get it at:
http://retrobits.net

many thanks to my vast team of beta testers! (er... well, OK... maybe I don't quite have a vast team yet, but it sounds kinda impressive)

Any feedback is welcome.

Thanks,
-Dan

Sounds like a very good idea. I saw something similar at the CGE
in Las Vegas. They were using a PC in an arcade case to run other
arcade games from the past like Paper Boy, etc. Looked run nice...

Hello all,

It has been awhile since I played this game and was wondering in the first level when one sets all the charges, how do you detonate them? I know you have to push down on a plunger, but I thought the plunger just appears and you just walk into it, but I could be wrong. I get all the charges set, but then, nothing else happens.

Ed,

I just loaded it up and played a round, yes after setting all the charges all you should have to do is walk into the plunger to set them off. There is an alt version floating around that has a green background and for some reason the plunger is not there so make sure the background (canyon walls) are orange. This is one of the first games I got for my Atari 400 way back when... on cassette even... I love this game. LOL.

Just curious what your favorite game for the Atari8 is? I think my favorite was/is Star Raiders, in fact it's what made me buy an Atari 400 in the first place. The first time I saw it I was totally blown away.

# 1500. [Still FS] FTe Sweet16 65c816 CPU for Atari 8-bit

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-01 22:30:38 UTC
From: bill@newbreedsoftware.com
Message-ID: <iwa8a.69564$lk.3034530@typhoon.sonic.net>
Source record: 22963

I still have a Fine Tooned Engineering (FTe) "Sweet16" for sale.

Asking USD $100. Shipping is included.

Sweet16 is a 65c816 CPU with another chip on its belly, which plugs
directly into your CPU slot on an XL or XE motherboard.

Assuming your CPU is slotted, you just pull out the 8-bit chip and plug
in the Sweet16 and you're good to go!

E-mail me if interested.

Yes, Star Raiders was the game that hooked me on the Atari's too. All people here in Norway bought C64's and I had to get the Atari instead. Also others that I think is worth mentioning is Rescue on Fractalus, Ballblazer, Bounty Bob (and Miner 2049'er), Dropzone, IK and actually it's too many to be listed. But, Star Raiders is probably number 1 still.

Take Atarian care

# 1503. PhillyClassic 4 Update: T minus 4 weeks until the big event...

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-02 00:05:57 UTC

Cross-posted to: rec.games.video.classic,rec.games.video.arcade.marketplace,rec.games.video.arcade.collecting,rec.games.vectrex,comp.sys.atari.8bit

Hi All!

For those of you that haven't visited the site in a little bit, check out the SPECIAL GUESTS section for some exciting news. We're working on a couple of other guests whose names you MIGHT recognize (wink, wink, nudge, nudge!)

http://www.phillyclassic.com

We're filling up with table registrations QUICKLY. They're 75% gone at this point. If you THINK you might want a table... if you've been waiting for JUST the right moment... if you feel you might need a LITTLE more room than what you've already reserved... or if you didn't know that a display table at the show is only $60 for all your buying/selling/trading/show-n-tell needs (AND includes a 3-day pass)... NOW IS THE TIME TO PURCHASE THOSE TABLES!!! Avoid disappointment and cruise over to:

http://www.phillyclassic.com/register.php

Hit that big ole VENDOR TABLE button, and we'll take care of it from there.

Ticket sales are also going at a good clip, and the sooner you register for a 2-day or 3-day pass, the sooner you can strike that item off your to-do list!

NOTE: We've had some inquiries about getting a 1-day pass to the show. ANSWER: 1 day cost $20 last year, so this year, when you pay for 1 day, you get the second day FREE. We're not selling 1-day passes, so if you can only join us for 1 day, you'll get the same deal as last year without the extra FREE bonus day!

REMINDERS: If you're a TRON fan, bring your TRON books, videos, videogame carts, whatever for Cindy Morgan to sign. Oh, and I guess same goes for Caddyshack items. Do you remember her famous scene in that classic film? [Ooo la la!]

If you're a SID MEIER fan (Hello?!? Aren't we all???) same goes for your copy of F15 Strike Eagle, Silent Service, Pirates, Red Storm Rising, Railroad Tycoon, Civilization, and countless other landmark classics.

If you're a TABLEHOLDER and plan to bring some goodies to plug in and play/demo/share during the show, remember to bring your classic

gaming trade show supplies, which should include:

TV's, monitors, extension cords and power strips, duct tape, extra controllers for your consoles, a dropcloth or tarp to cover your table(s) should you want to come late/leave early, Shopping list, Personal collection list, Want lists, Trade lists, cell phone, room in your suitcase for once-in-a-lifetime deals and incredible rarities!

==========
Where will YOU be 4 weeks from right now (Saturday 5:39pm EST)?

* Having dinner with a bunch of guys from r.g.v.c.?
* Trading up a storm on the show floor?
* Playing Dance Dance Revolution and sweating like a pig?
* Watching the movie Joysticks and wondering how movies that bad got made?
* Rocking out in homebrew heaven at the Atari Age booth?
* Playing your favorite coin-op in the QuarterArcade megaplex on the show floor?
* Jumping up and down screaming after having won a $100 gift certificate from EB?
* Holding up your flashy new PC4 t-shirt and showing it off for your girlfriend?
==========

Stay tuned...

# 1504. Re: Atari 1200XL Keyboard not working

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-02 00:40:09 UTC
From: Tim <tjlazer@mail.com>
Message-ID: <v62kncj2jhhqbe@corp.supernews.com>
Source record: 22967

Well my 1200 is happy now...! I removed the Mylar sheet and there was no other half. It was a clear pastic sheet with a white rubbery part that was on the PCB side, I guess to hold the sheet to the PCB. I ripped some of the rubber around the screw holes but it was still intact. I gently pulled it off the contact points from the PCB where it all gets contact and I put it all back together and it worked! Thanks for the tip. One thing I am worried about is that when I took it off the contact points it kinda ripped off a little, but not bad, should I get some silver paint like the Web Site the other posters provided says? I guess if the keys fail again I'll go ahead and do that for sure...

Thanks!
Tim

I am someone else who'd have to say "Star Raiders". Not only did this game thrill me like no other, but it's where I got the handle "Cruiser 7" from.

The rest of my top 5

2. Alternate Reality (City & Dungeon)
3. Ali Baba and the 40 Thieves (I am STILL working on a mini guide for this game)
4. Archon
5. Tie between Pharaoh's Curse and Bruce Lee

And I'll 2nd that, MULE is THE best game! ;-) And is the only Atari 8bit game I still play quite often.
But that said, Star Raiders is no.2!!

Too many to mention! 8) If I *have* to pick one... Ballblazer.
Not only it's a darned fine game, I like the way it neatly encapsulates
the strength of the A8 (DL grids, scalable PM/G, 4-ch audio).

Tried typing
NEW
and then
ENTER "D:filename.ext"
?

Or is it BASIC at all, the file you are trying to load ?

If memory serves correctly, that error results from attempting to load
a binary file from basic. I'll bet if you go to DOS and do a binary
load, it will work.

# 1526. FA : 100 boxed , new ATARI XEGS/XL carts

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-03 04:53:16 UTC

Yes, Star Raiders was my fave, also. Nothing so satisfying as getting
a lock on the enemy and having both your torpedoes fire at once,
obliterating the target.

As for Rescue on Fractalus... how many of you almost wet your pants
the first time that danged alien jumped up in your face and started
pounding on your window? I was so shocked the first time that I
didn't even remember to turn on my shield to disintegrate him. Of
course, he busted through the windshield and let in the acid-filled
atmoshpere... :)

I had a go at 'the city' for the first time last week and now have two questions!

1: The version I found was in the form of four .Atr images, however at one point the game asked for the wilderness disk and none of the images seemed to work. Is there another .Atr I've missed...?

2: Is there any user guides on the net..?

Tia, Dunx

He said it was a BASIC file, but that was my thought too. Or if the BASIC file was LIST(ed) and he needed to ENTER it back in. Won't that make the same error ?

I always had a hard time starting this. It's so difficult to survive. I get killed and can't afford health very soon. Especially in the City. What's the secret to staying alive in the beginning ? Ever tried Shining Force 3 on the Sega Saturn ? That's a really great RPG, with the best battle system I've ever had the please of encountering. All Shining Force games are wonderful, really. The graphics in Alternate Reality was awesome though. And the best music from Atari ? Perhaps The City, it really is awesome. Listened to that again and again when I first got my game. Gilbertson is really excellent.

Don't know about point 2 but as far as the wilderness is concerned, it was never written. The idea was that you could just wander into the connecting game. Only the City and the Dungeon were ever written tho. The Dungeon is better imho.

Mark

Not a game exactly but... Flight Simulator II is my all-time favourite! A whole 'world' with 'real' and defined boundaires that you could explore exactly as you choose without being artificially limited by the computer (or programmer) in any way. No wonder it spawned that whole series of FSII adventure books by armchair pilot Charles Gulick.

The fabulous packaging with handbooks and flying guides, aeronautical maps and charts and an add-on scenery disk. Not cheap at almost 40GBP but well worth it for the fun I've had with it over the years.

I loved it then and I love it now.

It was also a challenge to crack and remove the copy protection so that I could play it from a hard drive (and now from within emulators!). This I did successfully 18 months ago (yes, it took me that long -- details of how posted in this newsgroup Christmas 2001)

Others: Ballblazer (*that* music!), Fractalus (yes, the shock of the alien banging on the window) and Mercenary which is never rated very highly but which is a nice demonstration of smoothly scrolling graphic manipulation...

On Sat, 01 Mar 2003 20:11:24 GMT, Hon Tseng wrote:
> I have a prosys cable. it does not work with XF551 disk dirve. Any
> idea you suggest?

Short answer:

Try building a 1050-2-PC cable with a MAX 232 (as described
in the SIO2PC docs), and don't forget connecting +5V to the
+5V/Ready SIO input pin of your disk drive. At least the
1050 won't do anything if this signal is not
present - cost me about two hours to find out...

Long answer:

There are at least two possible pitfalls when using the
ProSys cable:

The RS232 voltage is out of spec, and using a 14C89 (as listed
in the APE docs) might cause troubles when interfacing with TTL.

I don't know the signal specs of the XF551, but I assume it
is standard bipolar TTL with a Vout_HI_min of 2.4V. According
to the "C" in 14C89 I assume it is a standard CMOS type IC
(I don't have the datasheets here ATM) with a Vin_HI_min of
some 3.5V. Given that my assumptions are right, this
combination _may_ fail (IOW: it might work, but not under
all circumstances).

so long,

Hias

Boulder Dash, especially the Boulder Dash Construction Kit. Back in
the late 80s a friend of mine and I spent lots of time playing
and building levels. Even nowadays we regularly play our old levels!

There are at least some 10 or 15 other games I like very much
(eg Ballblazer, Master of the Lamps, Schreckenstein, Quest for Tires,
Miner 2049er, Aztec Challenge), but they all can't beat BDCK :-)

so long,

Hias

What Mark said.
>
> 2: Is there any user guides on the net..?

Not that I know of. There used to be a guide or two in old forems like the
Compuserve RPG group.

Getting started in the game is extremely hard. There are a few utilities
floating around to resurect dead characters. The game is somewhat
traditional in that you don't get to see all your characters attributes like
luck and speed. You have to get used to the idea that some characters just
weren't meant to survive and you won't know it until they repeatedly die.

Assuming you don't use any of the character hacks, about the only way to
advance a character is to save after every encounter you win. Once you get a
save, you have to exit the game and make copies of your live characters'
save game disk. It is fairly easy to do if you are using ATRs and a IBM type
computer for storage. I would just label my saved games like LEVEL3.ATR,
LEVEL4.ATR, and so on.

You want to find one of the cheap taverns for food and a cheap inn to spend
the night. Hit points are restored best if you sleep straight through from
~10PM to 8AM game time. You have to make sure your character has plenty of
food and drink before you put them to bed or your gold will be wasted.

You're not doing anything wrong! It *is* very hard to start a
character. Here are a few (City) tips:

I value wisdom and intelligence above all. Then comes strength and
skill. Wisdom helps you figure out what potions are before they go
poof. You'll need intelligence to trick monsters in the beginning.
Also, I *think* it helps you determine whether armor/weapons are
magical or not (although it may be wisdom that is the factor here
instead). Strength is on the "B" list because you use it so often it
goes up even between level jumps. Skill is self-explanatory. The
reason why I don't try for harisma, hit points and money is because
they are hard to keep track of. Hit points and money are in corners
that are hard to see, and charisma spins way too quickly.

Go to Occum's Weaponsmith to get a cheap dagger then sleep and wake up
first thing the next morning. Then visit all the guilds you can to
boost your attributes.

When you can, buy a few rounds for the house. When they start
cheering you, the bartender and the waitress will be your friends, and
they will take care of your thirst and hunger if you are in dire need.
Don't forget to actually buy a few things here and there to keep them
happy.

# 1544. 3SDOS, a read-only dos in 3 sectors (384 bytes)

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-03 21:19:14 UTC
From: Carsten Strotmann <cas_news@strotmann.de>
Message-ID: <b40gj1$1qg8im$1@ID-174234.news.dfncis.de>
Source record: 22857

About

* Assembler: BiboAssembler 1.21
* License: GNU Public License, http://www.gnu.org
* Author: Carsten Strotmann
* Version: 0.8
* Description: Mini-Read-Only DOS 2.x compatible

Why?

Why I've written this DOS? I had a BASIC Cassette program. The program consists of two files, part1.bas and part2.bas . The first part initializes a new character-set and the starts the second part via the CLOAD command.

The second part was really large. Because the cassette load take some time, I would like to have a cassette version. But with a normal DOS loaded (MyDOS, ATARI DOS 2.x, 3, DOS XL, Turbo DOS, I tried almost all), there was only some byte free memory left. Too less to run the programm.

So I tested serveral game-dos. (btw, thanks to Matthias Reichl for the new GPL Release of MyPicoDos, http://www.horus.com/~hias/atari/ ). But the game-dos I own don't install a "D:" CIO Handler, they just load the file and start it. That is ok for one-part files, but it didn't work with my two-part file.

So I wrote 3SDOS. It's 384 Bytes long and fits into the first 3 bootsectors. With this, the basic-cassette program works! And it has 4k free space.

Limitations:

* only read operations
* "open file" and "get byte" CIO commands
* only finds files in the first directory sector ($169), so only the first 8 directory entries work
* no checks
* slower that normal dos load, but dos starts very fast!
* maybe buggy

Future development

* Autoload and Start Basic program in the first Directory entry, for real Basic-Boot-Disks
* keep it in 3 sectors (SD)

I am using the Magnavox RGB Display80 aka C=1084 which does an OK job but does cut off half the top line and all of the bottom line. Also the contrast must be adjusted down quite a bit for it to look decent.

Thanks! I guess I dig it out again, as soon as I know where it is :-/ Just moved (okay, 5 months ago, but not done putting it all in place yet). I have too many consoles and computers to keep up, but I usually have the PC, Atari 130XE, Gamecube, Dreamcast, Jaguar, Megadrive/Genesis handy.

I always starved, so the tip about buying rounds sounds like a solution.

Thanks again and take Atarian care

I'd say "Mercenary". That's definitely my favourite.

Followed by the first four Lucasfilm games (still can't believe "Labyrinth"
was not to be on the A8), plus "Alternate Reality The City / The Dungeon".

Ah, yes, and "The Goonies".

Oh, and "Blue Max".

It was prettier, but I don't know about better. IIRC, I was harrassed throughout the game by some monster that sucked in my equipment before I could kill it. After awhile I was destitute because of running into that thing 5 or 6 times in a row. The game never gave me a clue as to what that critter was or what its presense meant, and what if anything I could do about it. The point is you can't play the Dungeon for a long period of time, that equipment sucking monster won't let you.

I read an interview with the programmer where they were kind of laughing about that. They had to deal with object count in a game that could run on a 48k computer so they created "The Devouer".

They gave a hint on how to avoid getting burned. IIRC it was to not carry to many similar items. If you just had one of each type of item and maybe a spare you were ok. If you had 5-6 swords and 20 pieces of armor you got in trouble.

I just checked my floppy disks this weekend:

The official disks for the first special issue on Atari computers
("Happy Computer - 1. Atari Sonderheft") in 1986 contained an
Atari 800 version of TurboBasic. It's also coming as a large
DOS.SYS file. I'm not sure if it is connected to "Frost Basic",
but at least there is an official version.

If anyone's interested, just email me.

so long,

Hias

That was me, but it's not On-Track. It's by a british company, says
something before the race and it's on tape. Might be Mastertronic, but I
suspect one of the budget titles anyway. GBP 1.99 I think it was.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Steve,

Yes I love the game also. I have the cassette version and it was
my first computer game. I also have an ATR version that I
converted to DI image. I am sure the background is orange. When I
set all the charges I am not seeing the plunger. Just where does
it appear? Maybe I have a faulty version. I will check it out.

Mine is a toss-up between Ultima III and Castle Wolfenstein. I had
so much fun with those two games especially the Ultima's 1-3.

Not Ultima IV ? I think that was excellent on the Atari. I did like U III also, nice atmosphere, but I never completed it, which I did with IV. Did you like Beyond Castle Wolfenstein (I think that's what the other one was called)

Source record: 22875

No Not with 400 because it has 16Kb normal and maximum 48Kb.

The 600XL has normal 16Kb but when upgraded to 64Kb internally or with a
1064 memory kit it can run this cartridge.

Every XL/XE with 64Kb or more can run it...

The cartridge is very cool....

Well,
there is a PD version of GO! in the Abbuc Pd-library, next there is a
commercial Go version from Odesta (the same company that brought us
Chess 7.0 and Checkers). but the odesta version only works under the
400/800 OS. That`s all I remember right now... -Andreas.

I tried posting a reply last night, which doesn't seem to have gone through.

The 'ENTER' solution worked ... kinda.
It only loaded 4 lines of the file. There should be 128 lines.

The ERROR it gave was ::

ERROR- 164 AT LINE 2040

2040 being the 4th line of the file.

Can anyone help me out with BASIC 'ERROR- 164 AT LINE 2040' ?
Sorry for all the rookie questions. Your replies are much appreciated.

cheers, -d.

164 is a hardware error, either you are loading from a bad disk or the
program is machine language and needs to be loaded with dos and no basic.

I looked it up- Error 164 a POINT statement moved the file pointer to a sector that's not part of an open file. Or a disk is scrambled; the intra-sector links are disorganized and inconsistent.
Sounds like this file is corrupt, or like I said it's machine language and needs DOS.

# 1572. atari++ 1.20 released

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-05 10:04:23 UTC
From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <b44i37$ice$1@mamenchi.zrz.TU-Berlin.DE>
Source record: 22885

Hi folks,

atari++ 1.20 has been released. This is mainly a bug-fix release, only minor additions have been made - as the configurable atari 130XE compatible Ram disk support.

Atari++ 1.20:
- Fixed name resolution in the generic device handler.
(This broke H: successfully in 1.19)
- Fixed handling of DD disks. (Thanks, Matthias!)
- Fixed error handling within the menu.
- Added emulation of various XE like RAM expansions
that use bankswitching controlled by PIA Port B.
(Thanks, Andreas!) This is still experimental, though.
- Fixed endian dependentness of Antic emulation.
- Fixed a possible CPU pipeline trash on the G.M
monitor command.

Plans for future releases:

1.21 will most likely provide access to 1050/810 Atari diskdrives by means of proper cables thanks to the "atarisio" interface of Matthias Reichl. It was still in an unfinished state for the 1.20, but I first wanted to get a couple of bugs fixed before I'm going to introduce new ones. (-;

Maybe there will be also "alsa" support without the "oss" layer, all provided I find a suitable documentation of the alsa API. I haven't been able to find a proper and sufficient documentation for the features I need, yet. If you know where to obtain a real manual please let me know.

Greetings,
Thomas

# 1573. Re: GO Game on 8-bit?

Newsgroup: comp.sys.atari.8bit

From: Dan Vernon <newsgroups@retrobits.net>
Message-ID: <b44vln$j54$1@news.chatlink.com>
Source record: 22886

Achieving "smart ai" for Go on the 8-bit is basically impossible (at least in a playable version of the game that wouldn't take days or years between moves). Even with the most modern hardware, all available Go programs today can be easily beaten by beginning and average strength Go players. Unless you've never played Go before, the Atari versions will disappoint very quickly.

Check out this Seattle Times article about computer Go:
http://archives.seattletimes.nwsource.com/cgi-bin/texis.cgi/web/vortex/displ
ay?slug=gogo29m.art&date=20000829

I'd recommend GnuGo... its available for many platforms, is free, and plays well enough for a beginner to learn the game.

-Dan

If you have your reference handy...

Does it say what error you get when you try to use an enhanced density disk
with DOS II?

I seem to recall formating disks in the ~1040 sector format and then having
trouble reading those disks under DOS II. The directory and start of the
file would sometimes be right but it would bail out as the sectors went over
720.

thanks for the article. I will keep in mind, that a "smart ai" isn't
possible on very slow platforms like 8-bit atari. I remember the
fascinating game called "Gomuku". It was also nearly impossible to beat
the game ai. I assume, that the game had some serious problems with the
memory on a specific point. Then the ai makes some really stupid moves,
and ignores risky constellations.

however, both games (Go by Stan Erwin and Gomuku by S.Baker) can be
found on this url:

http://www.atari8bit-software.de/

click on "Spiele (sortiert)" (games sorted) and look for "go"
respectively "gomoku".

Your post made me think back a bit. I used to routinely beat Sargon at the default difficulty level so when Antic published a program that played checkers I thought I would be able to beat it too.

I never won a single game and finally gave up in frustration. I was rusty playing checkers but I don't think it would have made a difference.

The program/Atari had taken 3rd place overall in a computer checker competition. I remember one of its losses went to a tricked out Mac and I can't remember the other hardware that beat it, dual pentium or something like Sun box I think.

I went to an AI conference in 1997. From presentations there it seems
that software has been written that plays perfect Checkers, meaning it
is impossible for a human to do better than tie against it. Chess,
Go, Bridge remain unmastered by computers, though the state of the art
is very good nowadays. Go seems especially problematic, even
compared to Chess, though IIRC, good software will beat all but
mature, highly competent Go players.

All these algorithms require a lot of grunt to be tractable,
ultimately the problem turns into traversing search spaces. Good AI

on an 8-bit is probably very nearly impossible. OTOH, perhaps Alice-like approaches might work, where pattern matching algorithms select canned responses. This approach is easy to implement and can provide uncannily good responses to textual queries- and it also allows you to cheat by canning subtlty.

Gregm

Quoting 'Your Atari Computer' by Ion Poole,
The only two mentioned DOS version are 1.0 and 2.0S
"DOS 2.0S can read disks formated by DOS 1.0 but not the opposite. Random errors can occur if a disk created with DOS2.0S is read by DOS1.0"
Doesn't mention enhanced density, I think this book actually predates the 1050 drive. I'll keep plowing through my dustshelves and see what I find.

## 1581. Disk Labels

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-06 04:14:17 UTC
From: llppwhite@aol.comnsp
Message-ID: <20030305231418.15548.00000092@mb-ms.aol.com>
Source record: 22894

I recently purchased a Brother PT-1500 PC label maker, and thought a few folks might be interested in the product. The 1500 uses TZ series 1/4" -- 1" label tapes and it hooks up to the PC (or Mac) via USB. It has Win software and allows creating very professional-looking labels. The P-Touch TZ series tapes come in several background/print colors, and most are laminated with a clear covering over the actual label.

I must admit to being a neat-freak about disks and labels, and these make the best (non-comercial) labels I've ever seen. IMO they are definitely a cut above paper labels printed on a regular printer. I paid $70 for mine at officedepot.com with free shipping. Unfortunately, the label tapes are not cheap. They list for $15-20 per 26 foot roll, but I was able to find them for about 1/2 price with a little looking. If interested, check it out at www.brother.com

## 1582. why XF351, 1055, and 1053 never released?

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-06 04:31:03 UTC
From: Hon Tseng <pcuser45@yahoo.com>
Message-ID: <baA9a.118200$P1.7451301@news1.east.cox.net>
Source record: 22895

I read the article about Atari disk drive family. According to the article, 1055, XF351, and 1053 were never released. I'd like to know why they were not released. Any idea?

# 1583. Atari 1200XL Keyboard repair

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-06 04:33:32 UTC
From: Tim <tjlazer@mail.com>
Message-ID: <v6djt1qfv7uj7e@corp.supernews.com>
Source record: 22896

I used the advice from people on this group and was able to improve the keyboard functionality of my 1200XL. At first almost all keys were dead. After removing the mylar sheet and cleaning the PCB all but 1-3 keys will work flawlessly. A few will still be a little flaky but the more I push the better they work. It seems to be differnet keys every time I take the keyboard apart.

My question is, does this indicate that the actual contact under the key is not working well or the several vertical contacts to the PCB? I was thinking of getting some silver conductive paint to get better contact but it won't help if it's the actual contact under the key.

Anything else I can do to better the contact of the keys?

Thanks
Tim

IIRC: The word out of Atari was that software distributers did not want to
add 3.5" support for the Atari so those were dropped in favor of the XF551.

I don't know about the 1053. There were a lot of 8 bit things in the works
that just got dumped when the Tramiels took over. They believed the future
was going to be 16 bit. Going XF551 vs. the 1053 meant they could use the
same disk controller chip as the ST. There were also some rumors at the time
that Atari got ahold of some bargain basement 8050 microcontrollers so that
was the way they went.

Not directly related but could be a reason. The 815 dual drive system ended
up being unreliable and actually would have cost more then buying two 810s.
It could be the 1053 with 4x as much storage as a 1050 was going to cost 5x
as much.

# 1586. Re: Formatting HD w/ SpartaDOS on Atari800Win

Hi Folks,

The same problem is there when you use MYIDE and Spartados/Bewedos. With myDos there is no problem at all. I have already a beta version of my 16mb formatter finished (only works on D2:, and there are no security questions, so be carefull) ... with this version you should setup a 16mb (65535 sectors/256bytes a sector) ATR and put it in D2: run the format software on D1: and after a few seconds your D2: is formatted. (16mb)

I'm working on a user friendly program that allows you to format any Dx on 16mb. It will only support 16mb; I think with todays large HD's you only want to format 16mb or you use stock .ATR size. The next version will have build-in security question, AND it will be erased from memory (to protect there will be a format after an (illegal) jmp to the format program in memory.

I'll keep you informed.
If you can't wait :-) you can mail me for that format program ...

Ah and before I forget, it automatically writes the volumelabel "MYIDE" on that atr. But that can be changed with another tool if you want it (I designed the progam not in first place to work with an emulator, but it works fine on that)

Howdy Bob

Why don't you try tro squeeze some color out of the XEP80? According to the data sheets of the NS405 (main controller inside the XEP80) it can be done quite easily. Data sheets are available at freetrade.com I heard.

BTW will there ever be a next issue of Atari Classics? I've payed for 4 more mags and 2 more disks IIRC.

Isn't there a knob somewhere on the front or back that let's you shrink the
screen? My Philips CM8833 has both horizontal and vertical shrink and so
does my 1084.

Howdy folks

Just a quick question:

As many will no know, you can substitute the ':' character for the '>'
character in MyDOS 4.5x.
One could use e.g: D1>SUB1>FILENAME.EXT instead of D1:SUB1:FILENAME.EXT

Does anybody use this feature?

Yes, I use it sometimes. Because Sparta and Bewe also use '>'

Why do you ask?

## 1593. 65XE Monitor Jack Question

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-06 21:30:39 UTC
